**mayr<sup>®</sup>**  
your reliable partner

## Construction and Development

### Innovations for Your Success

With our innovative and economical solutions, we are able to set new records in the field of power transmission. Our many worldwide patents prove our constant ambition of developing better and technologically superior products.

Highly qualified engineers, high-performance 3D-CAD-systems and the most up-to-date FEM calculation aids used in our Development and Construction departments mean that our business is perfectly equipped to offer our customers effective solutions.

### Experts for all Drive-technological Questions

Exploit our know-how, gained by decades of experience in the development, production and application of power transmission products. Our experts in Construction and Development are happy to advise you personally and competently when selecting and dimensioning the drive solution you require.

## From Prototype to Finished Product

***No mayr® product is released onto the market until it has proved its functional capabilities and reliability in extreme, long-term tests.***

The spectrum of testing equipment is as varied as our range of products:

- ☐ Friction work test stands
- ☐ Wear test stands
- ☐ Noise measurement room with highly accurate noise measurement inspection devices
- ☐ Torque measurement stands up to 200.000 Nm
- ☐ Impact- and continuous-operation alternating load test stands
- ☐ Force test stands
- ☐ Linear movement test stands
- ☐ Continuous performance test stands
- ☐ Magnetic flow measurement test stands
- ☐ High-speed test stands up to 20.000 rpm
- ☐ Misalignment and angular misalignment test stands
- ☐ Load and measurement test stands for DC motors

## Product Data: Our 24-hour Service

Our website offers you detailed information 24 hours per day, 365 days per year with no delays. Here you can find not only the latest catalogues and technical documentation but also CAD-files for cost-saving construction of our products.

Illustration of the stress distribution in a backlash-free connection

### Please Observe:

According to german notation, decimal points in this document are represented with a comma (e.g. 0,5 instead of 0.5).

## Unsurpassed - Our Standard Programme

As worldwide market leaders, we are able to offer the largest product range of load holding, load separating, torque and force-limiting, frictionally-locking, magnetic, controllable and switchable safety clutches. We can also provide you with the optimum protection element for your application.

## ROBA®-contitorque

If you require wear-free and reliable torque limitation, the ROBA®-contitorque continuous slip clutch and brake is your ideal partner.

Contrary to friction type clutches the torque is transmitted contactlessly via magnetic forces.

### Characteristics and advantages of the ROBA®-contitorque:

- contactless torque transmission
- excellent torque repetitive accuracy
- precise torque limitation
- free of wear –  
no contamination due to abrasion
- maintenance-free
- load holding
- applicable as clutch or brake
- compact design
- robust bearing
- easy graduated torque adjustment with  
direct torque indication
- low weight and mass moment  
of inertia

#### Function in smooth operation

The ROBA®-contitorque synchronously transmits the set torque from an input shaft to an output element, which can be attached to the clutch flange (Fig. 1).

Here, the operational torque  $T_B$  is below the limit torque  $T_g$  of the clutch (Fig. 2).

The torque is transmitted contactlessly via magnetic forces, which are generated by permanent magnets, and which magnetise hysteresis material.

#### Function in case of overload

If the operational torque  $T_B$  exceeds the set limit torque  $T_g$  the clutch slips, i.e. input and output components rotate to each other with a relative speed  $n_s$ , the so-called slip speed (Fig. 2). The hysteresis material is constantly magnetised and demagnetised and the clutch becomes warm.

The torque is transmitted asynchronously.

The clutch torque  $T_K$  also remains on the level of the set limit torque  $T_g$  in case of overload.

The set limit torque  $T_g$  also increases with increasing relative speeds due to eddy-current effects (Fig. 3).

Contact the manufacturer as to exact values for  $T_g$  and torque characteristic of the clutch.

After removal of the overload, the relative speed  $n_s$  returns to zero and the torque is again synchronously transmitted between input and output components.

Fig. 1

#### Torque adjustment

The torque on the ROBA®-contitorque must only be adjusted step-wise. After each step-wise adjustment, the clutch must slip, so that no pulsating torque occurs.

The ROBA®-contitorque is characterised by its quick and easy torque adjustment.

If no special torque is defined with the order, the clutch is set to the maximum torque at the factory. The set torque can be determined by means of a graduation scale, that can be found on the hub (Fig. 1).

If the torque requires setting to another value you have to (Fig. 1)

- loosen the radial set screws,
- hold the knurled flange and manually turn the set collar until the graduation scale indicates the required torque value,
- slightly correct the set collar until the marking notches of the flange and the set screws align axially,
- tighten the set screws again.

#### Clutch torque $T_K$ in case of overload

### Design characteristics:

- **Rustproof stainless steel design with stainless steel bearing**
- **Magnets and locking rings corrosion-protected**

#### Please Observe:

According to German notation, decimal points in this catalogue are represented with a comma (e.g. 0,5 instead of 0.5).

We reserve the right to make dimensional and constructional alterations.

We reserve the right to make dimensional and constructional alterations.

## Thermal design of the clutch

The ROBA®-contitorque slips in case of overload, i.e. input and output components rotate to each other with a relative speed, the so-called slip speed.

The hysteresis material is constantly magnetised and demagnetised by the magnetic field of the permanent magnets. On that occasion a power loss occurs, which must be dissipated to the environment in form of heat.

Otherwise the clutch would overheat unpermittedly and the magnetic material would get damaged.

The power loss in a continuous slip operation depends on the set clutch torque and the slip speed.

If the clutch is used e.g. with an assembly cycle and only slips a certain part of the complete cycle duration, then the calculated heat loss can be reduced in contrast to the continuous slip operation by means of the reduction factor V.

$$P_v = \frac{T \times n_s}{9,55} \times V \leq P_{v, \text{perm.}}$$

$$V = \frac{t_s}{t_{\text{cycle}}} \text{ und } t_s^{1)}$$

$t_s$	$\leq 30$ s for Size 1
	$\leq 25$ s for Size 2
	$\leq 20$ s for Size 3
	$\leq 15$ s for Size 4
	$\leq 10$ s for Size 5

The following applies to continuous slip operation: **V = 1**

$P_v$	= power loss of the clutch/brake [W]
$P_{v, \text{perm.}}$	= permitted power loss of the clutch/brake [Nm]
T	= torque of the clutch/brake [Nm]
$n_s$	= slip speed [rpm]
V	= reduction factor [-]
$t_s$	= slipping period [s]
$t_{\text{cycle}}$	= cycle period [s]

<sup>1)</sup> Valid for maximum torque adjustment with Type 150.200 and slip speed  $n_s = 3\,000$  rpm.  
For other torques and slip speed values for  $t_s$  please contact the manufacturer.

The following diagram shows the operating characteristic curve of the continuous slip clutch and brake ROBA®-contitorque.

The green range below the limit line of  $P_{v, \text{perm.}}$  shows the permitted range, in which the continuous slip clutch and brake does not overheat.

If the operating point lies in the red range, above the limit line, the clutch overheats unpermittedly and could be destroyed.

## Design examples

### Winding on and off of foil, yarn, wire etc.

(Application as brake in a continuous slip operation)

#### Given:

F	= 20 N	Winding tension
v	= 2 m/s	Winding speed
d	= 0,2 m	Winding diameter roll
V	= 1 [-]	Continuous slip operation
30 °C		Operation temperature

#### Required:

T	= ???	Brake torque
$n_s$	= ???	Brake slip speed
$P_v$	= ???	Brake power loss

$$T = F \times d/2 \Rightarrow T = 20 \text{ N} \times 0,2\text{m}/2 = 2 \text{ Nm}$$

$$v = r \times \omega = d/2 \times 2\pi \times n_s \Rightarrow n_s = \frac{v}{d \times \pi}$$

$$n_s = \frac{2 \text{ m/s}}{0,2 \text{ m} \times \pi} = 191 \text{ rpm}$$

$$P_v = \frac{T \times n_s}{9,55} \times V = \frac{2 \text{ Nm} \times 191 \text{ rpm} \times 1}{9,55} = 40 \text{ W}$$

#### Selected:

=> ROBA®-contitorque, Size 3, Type 150.200  
with  $T_g = 1,5 - 3$  Nm and  $P_{v, \text{perm.}} = 76 \text{ W} > P_v = 40 \text{ W}$

### Screwing on sealing caps

(Application as clutch in an assembly cycle)

#### Given:

T	= 2,5 Nm	Sealing cap screw-on torque
$n_s$	= 300 rpm	Screwing speed
$t_s$	= 2 s	Slipping period
$t_{\text{cycle}}$	= 10 s	Cycle period

40 °C Operation temperature

#### Required:

$P_v$	= ???	Clutch power loss
-------	-------	-------------------

$$V = \frac{t_s}{t_{\text{cycle}}} = \frac{2 \text{ s}}{10 \text{ s}} = 0,2$$

$$P_v = \frac{T \times n_s}{9,55} \times V = \frac{2,5 \text{ Nm} \times 300 \text{ rpm} \times 0,2}{9,55} = 15,7 \text{ W}$$

#### Selected:

=> ROBA®-contitorque, Size 3, Type 151.300  
with  $T_g = 0,5 - 3$  Nm and  
 $P_{v, \text{perm.}} = 18 \text{ W} > P_v = 15,7 \text{ W}$

## Safety Regulations

During operation of the clutch, its surface may become very hot. In this case, the user must avoid direct contact with the clutch, otherwise they may suffer injury.

The clutch housings have a safety label applied to them as a standard measure (Caution: hot surface) with the exception of the Types 151\_00.

The user can be protected from injuries by taking further safety measures:

- Mount guideline signs (Caution: hot surface) near to the clutch (responsibility of the customer)
- Enclose the clutch assembly (responsibility of the customer)

The clutch must always be installed so that direct heat exchange with the surroundings can take place unimpeded (do not cause heat accumulation when adding mounted parts). Encapsulation must not hinder the heat exchange.

Installation and effect must be carried out by appropriately trained personnel.

There is a risk of injury to personnel caused by the rotating clutch or rotating clutch parts.

The clutch works using strong magnetic fields. Strong magnetic fields could disrupt or destroy electronic or mechanical devices.

This is particularly the case for pacemakers.

Any data stores on credit cards, hard drives or disks could be deleted.

In order to avoid this, please maintain a sufficient distance (larger than 0,2 m).

The clutch must not be subjected to impact loads, as the magnets are extremely hard and brittle and can splinter on impact. Another risk is that mechanically-generated sparks can be caused by impact loads. For this reason, the clutch must not be operated in explosive atmospheres.

The clutch must not come into direct contact with metal chips, as these will be attracted by the magnetic fields, will contaminate the clutch and may disrupt its function.

The clutch housing must not under any circumstances be removed completely. Clutch parts will move due to the strong magnetic fields. This could result in seizure injuries.

- Danger of injury due to hot surfaces

- Danger of injury due to seizure during clutch installation and deinstallation

- Danger for people with pacemakers

## Installation

### Shaft fixing

The radial securement of the clutch onto the shaft takes place using a key connection.

The clutch can either be fixed onto the shaft using a screw and press cover (Fig. 4) or using a set screw (Fig. 5).

Fig. 4

Fig. 5

### Output elements (see also Installations Examples page 11)

Output elements can be centred onto the two flange key diameters and then screwed to the flange.

### Dimensions Tables for Key Connections

## Application Examples

### Screwdriving Technology

- Screwing on of various sealing caps with a defined torque

### Test Stand Technology

- Simulation of defined loads

### General Power Transmission

- Torque limitation with polishing machines

### Winding on and off Technology

- Tensile force limitation when winding on and off yarns, wires, foils etc.

### General Power Transmission

- Torque limitation in railway switch point drives

## Installation Examples

### ROBA®-contitorque with installed pulley (used as a clutch or as a brake)

The clutch is secured directly onto the motor shaft and the pulley is bearing-mounted separately using the deep groove ball bearing (used as a clutch for torque limitation).

The pulley is installed directly onto the clutch. The clutch functions as a bearing for the pulley and is rigidly connected to a machine wall (used as a brake for tensile force limitation of a belt).

### ROBA®-contitorque with winding drum (used as a brake)

The winding drum is mounted directly onto the clutch. The clutch functions as a bearing for the winding drum and is rigidly connected to a machine wall (used as a brake for tensile force limitation of the coiled material).

The winding drum is bearing-mounted separately. The clutch has no bearing function and is fixed rigidly to the machine wall (used as a brake for tensile force limitation of the coiled material).

### ROBA®-contitorque with flexible shaft coupling (used as a brake)

The clutch is rigidly connected to a machine wall and connected directly to the motor shaft via a flexible shaft coupling (used as a brake for the application of different loads onto the motor).

### ROBA®-contitorque (special design) for the connection of two bearing-mounted shafts (used as a clutch)

Special design for the connection of two separately bearing-mounted shafts. The clutch does not have its own bearing. The two clutch halves are secured to the two shafts using clamping hubs (used as a clutch for torque limitation).
