## Expert know-how in development and design

As the technological leader, *mayr*® power transmission focuses on continuous further development. Today, highly qualified engineers and technicians work on tomorrow's innovations using the most up-to-date tools. The years of experience and countless tests at the Development and Testing Department at the Mauerstetten Headquarters form the basis of conscientious lifetime dimensioning.

The values upheld by our traditional, family-run company also include long-term stability, independence as well as a good reputation and satisfied customers.

Therefore, we place emphasis on:

- Tested product quality,
- Optimum customer service,
- Comprehensive know-how,
- Global presence,
- Successful innovations and
- Effective cost management

## Tested quality and reliability

*mayr*® brakes and couplings are subject to meticulous quality inspections. These include quality assurance measures during the construction process as well as a comprehensive final inspection. Only the best, tested quality leaves our factory. All products are rigorously tested on calibrated test stands, and adjusted precisely to the requested values. An electronic database in which the measurement values are archived together with the associated serial numbers guarantees 100 % traceability. On request, we confirm the product characteristics with a test protocol.

The certification of our quality management according to DIN EN ISO 9001:2008 confirms the quality-consciousness of our colleagues at every level of the company.

## Specialists for power transmission for more than a century

*mayr*® power transmission is one of the most traditional and yet most innovative companies in the field of power transmission. From modest beginnings in the year 1897, the family enterprise has developed into world market leader. Worldwide, the company employs more than 1000 people.

### Unsurpassed - our standard range

*mayr*® power transmission offers an extensive variety of torque limiters, safety brakes, backlash-free shaft misalignment compensation couplings and high-quality DC drives. Numerous renowned machine manufacturers trust in solutions by *mayr*® power transmission.

### Available worldwide

With eight subsidiaries in Germany, sales offices in the USA, France, Great Britain, Italy, Singapore and Switzerland as well as 36 additional country representatives, *mayr*® is available in all important industrial areas, guaranteeing optimum customer service around the globe.

## Strongly positioned

*mayr*® sets standards in power transmission with economically viable solutions. For maximum competitiveness of your machines and systems, we always aim for the best possible cost efficiency, starting during the development of your clutch/coupling or brake right up to delivery of the finished and inspected product. For cost-efficient production, our factories in Poland and China represent the perfect supplement to the headquarters in Germany.

## Never compromise on safety

We make no compromises where safety is concerned. Only top products of a perfect quality guarantee that no people are injured or machines damaged in case of malfunctions, collisions and other hazardous situations. The safety of your employees and machines is our motivation to always provide the best and most reliable clutches, couplings or brakes.

*mayr*® power transmission holds numerous ground-breaking patents, and is the global market or technological leader for

- application-optimised **safety brakes**, for example for passenger elevators, stage technology and gravity loaded axes
- **torque limiters** to protect against expensive overload damage and production losses and
- backlash-free **servo couplings**.

Subsidiary with production department — *mayr*®-Poland

## ROBA-stop<sup>®</sup>-silenzio<sup>®</sup>

**Reliable dual circuit brake  
in accordance with DGUV  
Rule 115-002 (previously  
BGV C1), DIN 56950-1,  
EN 81-A3 and other  
international standards**

### Characteristics

- **Dual circuit brake as redundant brake system with a very short construction length**
- **Microswitch or proximity switch can be mounted for release monitoring**
- **Simplest possible installation**
- **No air gap adjustment necessary**
- **Continuously low noise levels for several hundred thousand switchings**
- **From size 200 on, the brake types with release monitoring are approved as protection against excessive upwards speeds and are also compliant with EN 81-1:1998 + A3:2009.**

### The quietest safety brake

Due to a newly developed noise damping unit, the ROBA-stop<sup>®</sup>-silenzio<sup>®</sup> is the quietest safety brake on the market, even in its standard version (pages 6 to 9). In new condition, the noise level is < 50 dB(A) (sound pressure level measurement). This value lies well below the noise level of the mounted drive elements such as e.g. motor and gearbox. Further noise reduction is possible. We can accord with your request as far as noise levels are concerned, and guarantee our performance with a legally binding inspection protocol.

### High operational safety

The ROBA-stop<sup>®</sup>-silenzio<sup>®</sup> is available as a single circuit brake or as a dual circuit brake. On the dual circuit brake, two independently operating brake bodies ensure high operational safety. Certain variants of this brake type series fulfill the requirements acc. DGUV Rule 115-002 (previously BGV C1), DIN 56950-1, EN 81-A3 and can be designed according to the requirements stated in ASME A17.

### Simple installation

The compact design as well as the single-part toothed hub ensures simple handling and installation. The working air gap is pre-set and needs no re-adjustment. This means that malfunctions due to operating and adjusting mistakes can be ruled out.

**EN 81-A3**  
-conform

### Safe choice due to large type and size variety

12 construction sizes in different designs fulfil the demands for elevator and stage drives with a braking torque range of 2 x 3 Nm to 2 x 2150 Nm and therefore cover all required operation areas.

If the power is switched off or in case of power failure or EMERGENCY STOP, the brakes ensure reliable and secure holding in any position; therefore, the brakes are intended mostly for static application as holding brakes.

### Optimised construction space

Due to new construction and removal of the complicated intermediate flange plate, we have been able to create a unique short construction length.

### Duty cycle

The ROBA-stop<sup>®</sup>-silenzio<sup>®</sup> safety brakes are optimised for a relative duty cycle of 60 %. For higher duty cycle, please contact the manufacturers. A duty cycle > 60% can lead to higher temperatures, which may influence the noise and switching behaviour of the brake.

### Brake monitoring for maximum safety

The ROBA-stop<sup>®</sup>-silenzio<sup>®</sup> safety brakes are configurable for comprehensive brake monitoring. They can guarantee maximum operational and functional safety due to the permanent monitoring of the brake condition and the optimisation of the friction system:

- safe brake control
- conditioning of the friction linings
- refreshing of the friction linings
- fail-safe release monitoring for checking the switching condition of the brake
- wear inspection of the friction linings
- monitoring and evaluation of the friction system temperature
- static and dynamic braking torque tests

## ROBA-stop<sup>®</sup>-silenzio<sup>®</sup>

\* Only on single circuit brake designs

\*\* Sizes 4 – 300 only on single circuit brake designs

## Installation Conditions (Figs. 1, 2 and 3)

- The eccentricity of the shaft end in relation to the mounting pitch circle must not exceed 0.2 mm.
- The positional tolerance of the threads for the hexagon head screws (8 and 8.1) must not exceed 0.2 mm.
- The axial run-out deviation of the screw-on surface to the shaft must not exceed the permitted axial run-out tolerance acc. DIN 42955 R. The reference diameter is the pitch circle diameter for securement of the brakes. Larger deviations can lead to a drop in torque, to continuous grinding of the rotor and to overheating.
- The tolerances of the hub (1) and the shaft must be selected so that no widening of the hub (1) toothing can occur, as widening of the toothing leads to the rotors (5 and 5.1) jamming on the hub (1) and therefore to brake malfunctions (recommended hub – shaft tolerance H7/k6).
- The rotors (5 and 5.1) and brake surfaces must be oil and grease-free. A suitable counter friction surface (steel or cast iron) must be used. Sharp-edged interruptions on the friction surfaces must be avoided. Recommended surface quality in the area of the friction surface  $R_a = 1.6 \mu m$ . **In particular customer-side mounting surfaces made of grey cast iron are to be rubbed down additionally with fine sandpaper (grain 400).**

## Short Description (Figs. 1 and 2)

Please find a detailed installation description in the Installation and Operational Instructions for the product (also at [www.mayr.com](http://www.mayr.com)).

- Mount the hub assembly with the O-rings (Item 1 / O-rings must be slightly greased) onto the shaft, bring it into the correct position (the length of the key should lie over the entire hub) and secure it axially (e.g. using a locking ring).
- Push rotor 1 (5) by hand using light pressure over both O-rings (2) onto the hub (1), so that the friction lining of rotor 1 (5) lies against the machine wall (the rotor collar should be facing away from the machine wall). Check that the toothing moves easily. Do not damage the O-rings.
- Push brake body 1 over hub (1) and rotor collar of rotor 1 (5) (the fixing holes should align with the threaded holes in the machine wall).
- Push rotor 2 (5.1) by hand using light pressure over an O-ring (2) onto the hub (1), so that the friction lining of rotor 2 (5.1) lies against the brake body 1 (the rotor collar should be facing the machine wall). Check that the toothing moves easily. Do not damage the O-ring.
- Insert the hexagon head screws (8) into the bores in brake body 2, which are equipped with distance bolts (16), and then join with brake body 1 and screw onto the machine wall. Tighten the hexagon head screws (8) evenly all around using a torque wrench to a tightening torque acc. Table 1.
- Inspect air gaps "a" according to Table 1.** The nominal air gap must be given.

## Hand Release

A hand release (6) is installed manufacturer-side, dependent on Size and Type (see Type key pages 7 and 9 and Table 1). From Size 800, both circuits are released simultaneously with a lever (see Fig. 4).

# ROBA-stop®-silenzio® – Brake Dimensioning

## Brake Size Selection

### 1. Brake selection

$$M_{\text{erf.}} = \frac{9550 \times P}{n} \times K \leq M_N \quad [\text{Nm}]$$

$$t_v = \frac{J \times n}{9.55 \times M_v} \quad [\text{s}]$$

$$t_4 = t_v + t_1 \quad [\text{s}]$$

$$M_v = M_N + (-) \times M_L \quad [\text{Nm}]$$

### 2. Inspection of thermic load

$$Q_r = \frac{J \times n^2}{182.4} \times \frac{M_N}{M_v} \quad [\text{J/braking}]$$

The permitted friction work (switching work)  $Q_{r \text{ zul.}}$  per braking for the specified switching frequency can be taken from the friction-power diagrams (page 14).

If the friction work per braking is known, the max. switching frequency can also be taken from the friction-power diagrams (page 14).

### Key:

J	[kgm <sup>2</sup> ]	Mass moment of inertia
K	[-]	Safety factor (1 – 3 x according to conditions)
$M_{\text{erf.}}$	[Nm]	Required braking torque
$M_v$	[Nm]	Delaying torque
$M_L$	[Nm]	Load torque on system * sign in brackets (-) is valid if load is braked during downward
$M_N$	[Nm]	Nominal torque (Technical Data pages 6 – 10)
n	[rpm]	Speed
P	[kW]	Input power
$t_v$	[s]	Braking action
$t_1$	[s]	Connection time (Table 4, page 16)
$t_4$	[s]	Total switch-on time
$Q_r$	[J]	Friction work present per braking
$Q_{r 0.1}$	[J]	Friction work per 0.1 mm wear (Table 2)
$Q_{r \text{ ges.}}$	[J]	Friction work up to rotor replacement (Table 2)
$Q_{r \text{ zul.}}$	[J]	Permitted friction work (permitted switching work) per braking (page 14)

Due to operating parameters such as sliding speed, pressing or temperature the **wear values** can **only be considered guideline values**.

## ROBA-stop®-silenzio® – Further Options

In addition to the standard brakes, *mayr*® power transmission provides a multitude of further designs, which cannot be described in detail in this catalogue.

Some of the most frequently requested options are:

- IP65 design with cover
- Dust-proof design with cover and cover plate
- Directly toothed shaft
- Terminal box
- ROBA®-ES-attachment
- Customer-specific flange plate

Please contact *mayr*® for further information

### IP65 design

The enclosed design (IP65) is equipped with a cover (Item 1).

Fig. 5

### Terminal box

Terminal box (Item 1) for the wiring and storage of rectifiers (ROBA®-switch, bridge rectifier).

Fig. 8

### Dust-proof design

The dust-proof design is equipped with a cover (Item 1) and with a cover plate (Item 2).

Fig. 6

### ROBA®-ES-attachment

Space-saving connection of a ROBA®-ES shaft coupling (Item 1) directly onto the hub.

The flexible shaft coupling of the ROBA®-ES Type series compensates for shaft misalignments and is vibration-damping.

Fig. 9

### Directly toothed shaft

Directly toothed shaft (Item 1) for larger shaft diameters and higher transmittable torques.

Fig. 7

### Special flange plate

We offer a range of flange plates for customer-specific solutions, such as for example the special flange plate shown in Fig. 10 (Item 1) with customer-tailored centering (Item 2).

Fig. 10

## ROBA-stop®-silenzio® – Switching Times

The switching times are only valid for the braking torques stated in the catalogue.

According to directive VDI 2241, the switching times are measured at a sliding speed of 1 m/s with reference to a mean friction radius. The brake switching times are influenced by the temperature, by the air gap between the armature disk and the coil carrier, which depends on the wear status of the linings, and by the type of voltage-limiting components.

The values stated in the Table are mean values which refer to the nominal air gap and the nominal torque on a warm brake.

**Typical switching time tolerances are  $\pm 20\%$ .**

**Please Observe:** DC-side switching

When measuring the DC-side switching times ( $t_{11}$  – time), the inductive switch-off voltage peaks are according to VDE 0580 limited to values smaller than 1200 volts. If other voltage-limiting components and constructional elements are installed, this switching time  $t_{11}$  and therefore also switching time  $t_1$  increase.

Switching Times Types 896._0_ _ _				Size											
				4	8	16	32	64	100	200	300	500	800	1300	1800

Switching times for the elevator industry acc. ESV Type Examination Certificate on request.

## ROBA-stop®-silenzio® – Electrical Connection

### Electrical Connection and Wiring

DC current is necessary for operation of the brake. The coil voltage is indicated on the Type tag as well as on the brake body and is designed according to the DIN IEC 60038 ( $\pm 10\%$  tolerance). Operation can take place with alternating voltage using a rectifier or another suitable DC power supply. The connection possibilities can vary dependent on the brake equipment. Please follow the exact connections according to the Wiring Diagram. The manufacturer and the user must observe the applicable regulations and standards (e.g. DIN EN 60204-1 and DIN VDE 0580). Their observance must be guaranteed and double-checked!

Supply voltage requirements **when operating** noise-damped brakes

In order to minimise **noise development of the released brake**, it must only be operated via DC voltage with low ripple content. AC current operation can take place using a **bridge rectifier** or another suitable DC power supply. Supplies whose output voltages have a high ripple content (e.g. a half-wave rectifier, phase angle control systems, ...) are not suitable for operation of the brake.

At variance with this, brakes specially dimensioned for overexcitation must be operated with the ROBA®-switch fast acting rectifier.

### Earthing Connection

The brake is designed for Protection Class I. This protection covers not only the basic insulation, but also the connection of all conductive parts to the protective conductor (PE) on the fixed installation. If the basic insulation fails, no contact voltage will remain. Please carry out a standardised inspection of the protective conductor connections to all contactable metal parts!

### Device Fuses

To protect against damage from short circuits, please add suitable device fuses to the mains cable.

### Switching Behaviour

The safe operational behaviour of a brake is to a large extent dependent on the switching mode used. Furthermore, the switching times are influenced by the temperature and the air gap between the armature disk and the coil carrier (dependent on the wear condition of the linings).

### Magnetic Field Build-up

When the voltage is switched on, a magnetic field is built up in the brake coil, which attracts the armature disk to the coil carrier and releases the brake.

#### • Field Build-up with Normal Excitation

If the magnetic coil is energised with nominal voltage, the coil current does not immediately reach its nominal value. The coil inductivity causes the current to increase slowly as an exponential function. Accordingly, the build-up of the magnetic field takes place more slowly and the braking torque drop (curve 1, Fig. above) is also delayed.

#### • Field Build-up with Overexcitation

A quicker drop in braking torque is achieved if the coil is temporarily placed under a higher voltage than the nominal voltage, as the current then increases more quickly. Once the brake is released, it needs to be switched over to the nominal voltage (curve 2, Fig. above). The relationship between overexcitation and separation time  $t_2$  is roughly indirectly proportional. This means that, using overexcitation voltage  $U_o$  (= doubled nominal voltage  $U_N$ ), the separation time  $t_2$  for release of the brake is halved. The ROBA®-switch fast acting rectifier works on this principle.

Operation with overexcitation requires an inspection of :

- the required overexcitation time \*
- as well as the RMS coil capacity \*\* with a cycle frequency higher than 1 cycle per minute.

#### \* Overexcitation time $t_o$

Increased wear, and therefore an increasing air gap as well as coil heating lengthen the separation times  $t_2$  for the brake.

For this reason, at least double the separation time  $t_2$  at nominal voltage must be selected as overexcitation time  $t_o$  on each brake size

The spring forces also influence the brake separation times  $t_2$ : Higher spring forces increase the separation times  $t_2$  and lower spring forces reduce the separation times  $t_2$ .

- Spring force (braking torque adjustment)  $< 100\%$ :

The overexcitation time  $t_o$  is less than the doubled separation time  $t_2$  on each brake size.

- Spring force (braking torque adjustment)  $= 100\%$ :

The overexcitation time  $t_o$  equals the doubled separation time  $t_2$  on each brake size.

- Spring force (braking torque adjustment)  $> 100\%$ :

The overexcitation time  $t_o$  is higher than the doubled separation time  $t_2$  on each brake size.

#### \*\* RMS coil capacity P

$$P \leq P_N$$

The coil capacity P must not be larger than  $P_N$ . Otherwise the coil may fail due to thermic overload.

#### Calculations:

P [W] RMS coil capacity dependent on switching frequency, overexcitation and duty cycle

$$P = \frac{P_o \times t_o + P_N \times t_N}{T}$$

$P_N$  [W]

Coil nominal capacity (catalogue values, Type tag)

$P_o$  [W]

Coil capacity on overexcitation

$$P_o = \left( \frac{U_o}{U_N} \right)^2 \times P_N$$

$t_o$  [s]

Overexcitation time

$t_N$  [s]

Time of operation with coil nominal voltage

$t_{off}$  [s]

Time without voltage

$t_{on}$  [s]

Time with voltage

T [s]

Total time ( $t_o + t_N + t_{off}$ )

$U_o$  [V]

Overexcitation voltage (bridge voltage)

$U_N$  [V]

Coil nominal voltage

#### Time Diagram:

## ROBA-stop®-silenzio® – Electrical Connection

### Magnetic Field Removal

#### • AC-side Switching

The power circuit is interrupted in front of the rectifier. The magnetic field slowly reduces. This delays the rise in braking torque.

When switching times are not important, please switch AC-side, as no protective measures are necessary for the coil and the switching contacts.

AC-side switching means **low-noise switching**; however, the brake engagement time is longer (approx. 6 – 10 times longer than with DC-side switch-off), use for non-critical braking times.

#### • DC-side Switching

The power circuit is interrupted between the rectifier and the coil as well as mains-side. The magnetic field reduces extremely quickly. This causes a quick rise in braking torque.

When switching DC-side, high voltage peaks are produced in the coil, which lead to wear on the contacts from sparks and to destruction of the insulation.

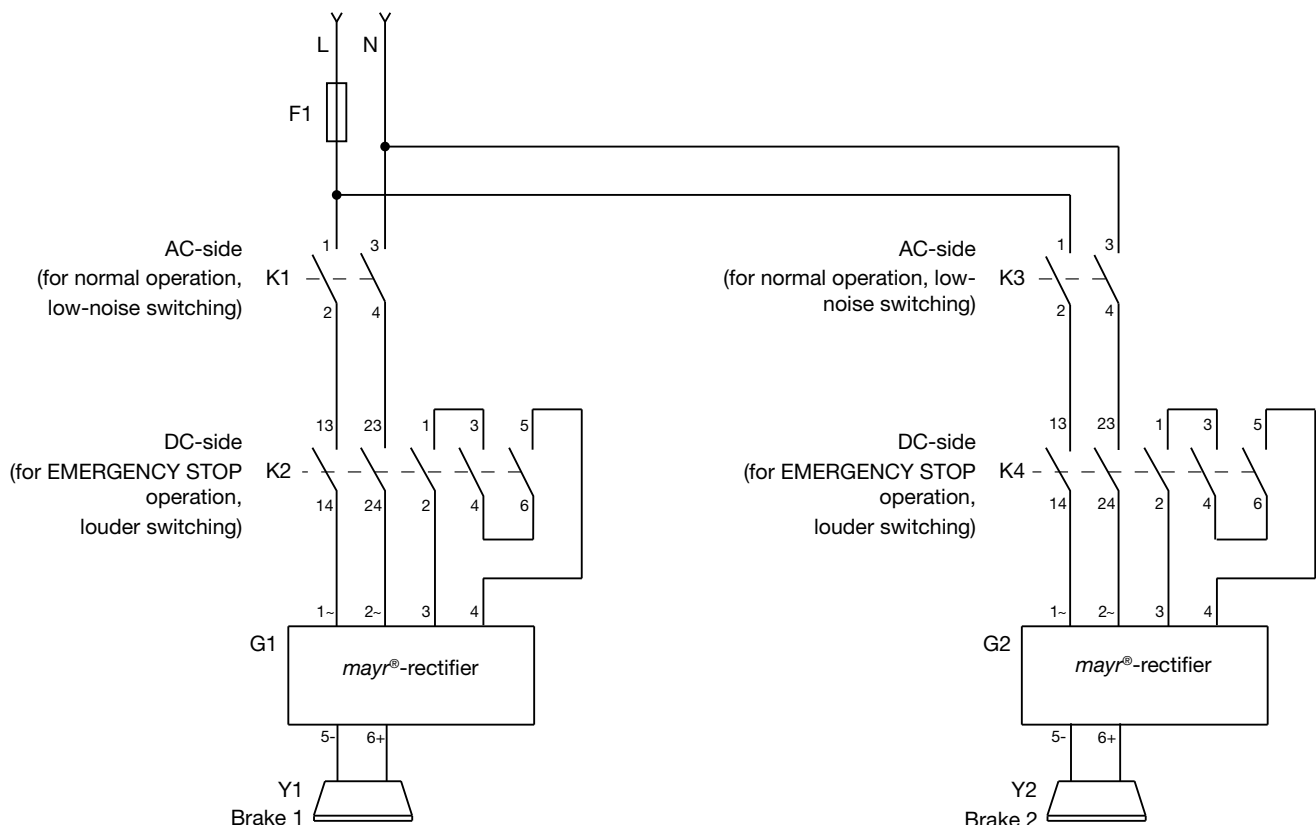

DC-side switching means **short brake engagement times (e.g. for EMERGENCY STOP operation)**; however, louder switching noises.

#### • Protection Circuit

When using DC-side switching, the coil must be protected by a suitable protection circuit according to VDE 0580, which is integrated in *mayr*®-rectifiers. To protect the switching contact from consumption when using DC-side switching, additional protective measures are necessary (e.g. series connection of switching contacts). The switching contacts used should have a minimum contact opening of 3 mm and should be suitable for inductive load switching. Please make sure on selection that the rated voltage and the rated operating current are sufficient. Depending on the application, the switching contact can also be protected by other protection circuits (e.g. *mayr*®-spark quenching unit), although this may of course then alter the switching times.

### Switching example

The *mayr*®-rectifiers shown in the Figure below serve as a switching example (e. g. combined switching for the elevator industry).

## Contactless Release Monitoring

- **Wear-free**
- **Robust**
- **Magnetic field-resistant**
- **Absolutely reliable**

### Function

Brakes in passenger elevators are subject to strict technical requirements. They have to guarantee the passengers' safety at all times. An indispensable element for safety brakes fulfilling the DIN EN 81 standard requirements is the integrated function monitoring. This release monitoring prevents unpermitted operating conditions, such as for example the motor starting up against closed brakes.

As an alternative to the tried and tested release monitoring with microswitches, *mayr*® power transmission, as the world-wide leading manufacturer of safety brakes in safety-critical applications such as passenger elevators or vertical axes, offer a contactless system with proximity switches. This fail-safe system with an inductive proximity switch registers the operating condition of the brake and authorises the motor to start up only after release. The contactless release monitoring guarantees maximum functional and operational safety.

### Maximum Reliability and Accuracy

As there are no mechanical parts involved, the lifetime of this new, contactless release monitoring system is not dependent on the switching frequency. The system is magnetic field resistant and works absolutely reliably and wear-free. It is also resistant to impacts and vibrations, as there are no movable parts, and the electronics are completely encapsulated. Other advantages of the inductive proximity switch are the high switching point repetitive accuracy, the low hysteresis and the low temperature drift.

The switching bolt for the proximity switch is installed at the factory and is, in contrast to the release monitoring system with microswitch, not adjustable. Application errors through adjustment of the switching point position can be excluded. This feature, too, plays an important role in maximising functional and operational safety.

### Optionally NO or NC Contacts

The contactless release monitoring system can be designed either as an NO or NC contact. With the NC contact function, the 'High' signal is generated if the brake is switched when de-energised. Here the armature disk drops and the brake closes. Initiator cable breakage is recognised when the brake is closed.

With the NO contact function, the 'High' signal is generated if the brake is energised and the armature disk releases the rotor. The brake is released. Only on generation of the 'High' signal is the motor enabled for start up. This reliably prevents the motor from starting up against a closed brake. Cable breakage is recognised when the brake is open.

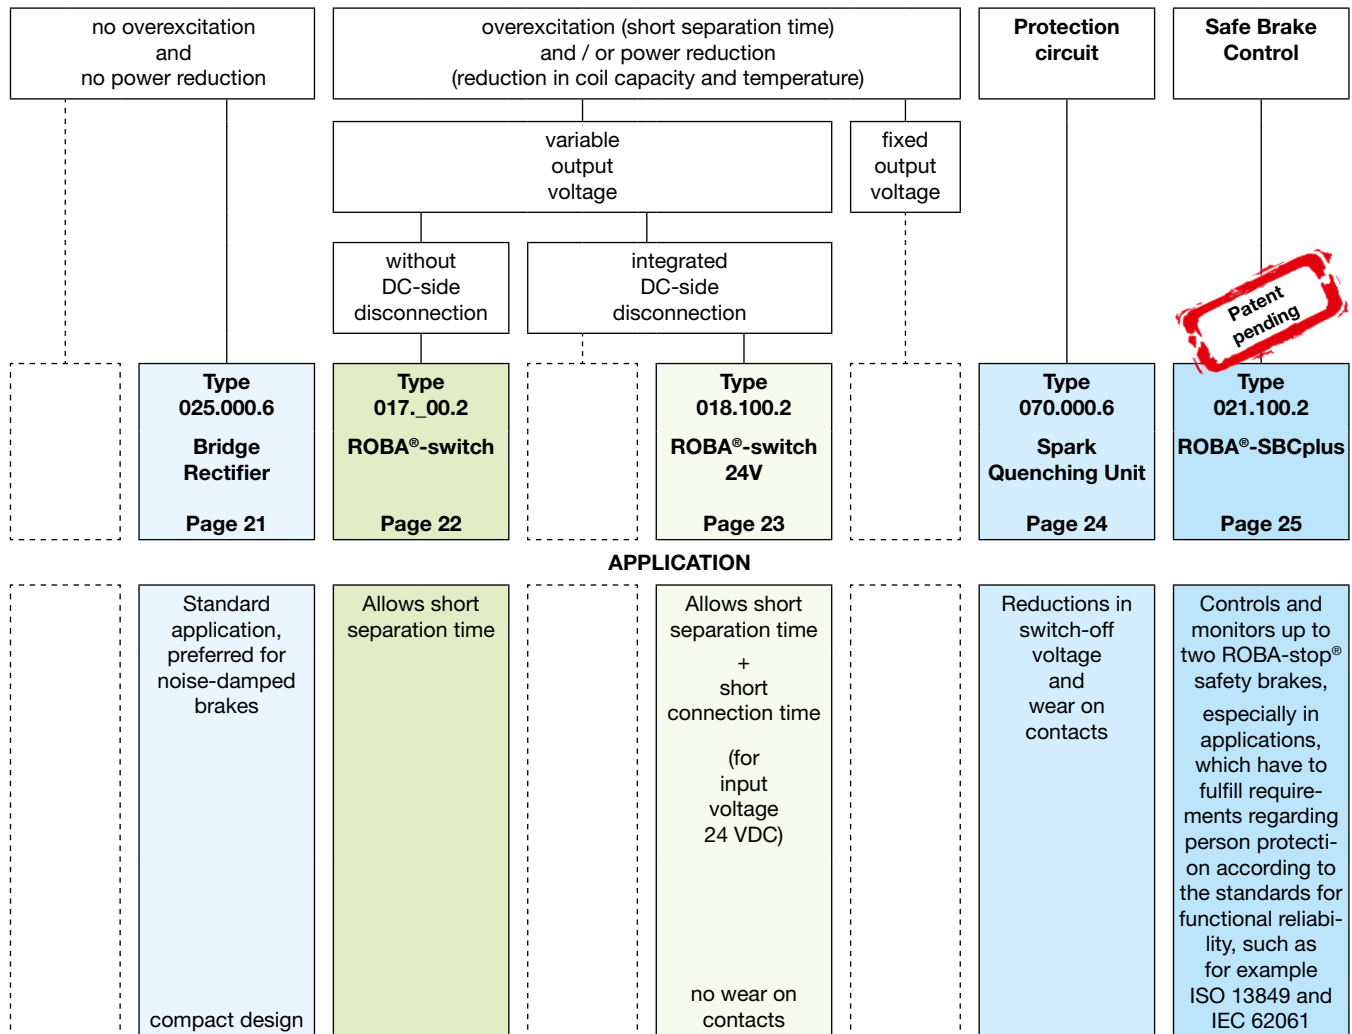

### Technical Data

Operating voltage	10 ... 30 VDC
DC rated operating current	< 150 mA
Ambient temperature	-25 up to +85 °C
Repetitive accuracy	< 0.015 mm
Hysteresis	< 0.025 mm
Temperature drift (-25 °C to +85 °C)	< +/- 0.05 mm

### Wiring Diagram

## Electrical Accessories – Functions of the DC Voltage Modules

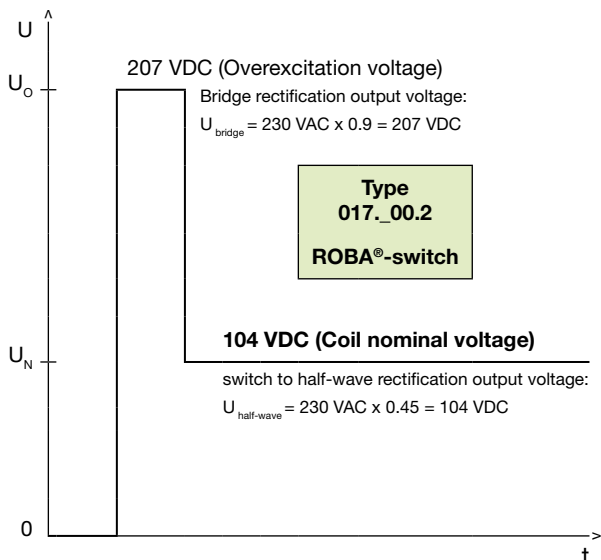

### Example

Available: mains voltage 230 VAC  
Wanted: short separation time (overexcitation)  
Required: supply module / coil nominal voltage

### Solution:

- Supply module: Type 017.\_00.2
- Coil nominal voltage: 104 VDC

**For detailed information on our DC voltage modules, please go to:**  
**[www.mayr.com](http://www.mayr.com)**

## Bridge Rectifier Type 025.000.6

### Application

Rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop<sup>®</sup>, ROBA-quick<sup>®</sup>, ROBATIC<sup>®</sup>), electromagnets, electrovalves, contactors, switch-on safe DC motors, etc.

### Function

The AC input voltage (VAC) is rectified (VDC) in order to operate DC voltage units. Also, voltage peaks, which occur when switching off inductive loads and which may cause damage to insulation and contacts, are limited and the contact load reduced.

### Electrical Connection (Terminals)

- 1 + 2 Input voltage
- 3 + 4 Connection for an external switch for DC-side switching
- 5 + 6 Coil
- 7 – 10 Free nc terminals (only for Size 2)

## ROBA<sup>®</sup>-switch Type 017.\_00.2

### Application

ROBA<sup>®</sup>-switch fast acting rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop<sup>®</sup>, ROBA<sup>®</sup>-quick, ROBATIC<sup>®</sup>) as well as electromagnets, electrovalves, etc.

#### Fast acting rectifier ROBA<sup>®</sup>-switch 017.\_00.2

- Consumer operation with overexcitation or power reduction
- Input voltage: 100 – 500 VAC
- Maximum output current  $I_{RMS}$ : 3 A at 250 VAC
- UL-approved

### Function

The ROBA<sup>®</sup>-switch units are used for operation at an input voltage of between 100 and 500 VAC, dependent on size. They can switch internally from bridge rectification output voltage to half-wave rectification output voltage. The bridge rectification time can be modified from 0.05 to 2 seconds by exchanging the external resistor ( $R_{ext}$ ).

### Electrical Connection (Terminals)

- 1 + 2 Input voltage (fitted protective varistor)
- 3 + 4 Connection for external contact for DC-side switch-off
- 5 + 6 Output voltage (fitted protective varistor)
- 7 + 8  $R_{ext}$  for bridge rectification time adjustment

### Technical Data

## ROBA®-switch 24V Type 018.100.2

### Application

ROBA®-switch 24V fast switching modules are used to operate DC consumers with overexcitation or power reduction, for example electromagnetic brakes and clutches (ROBA-stop®, ROBA®-quick, ROBATIC®), electromagnets, electrovalves, etc.

#### Fast acting rectifier ROBA®-switch 24V 018.100.2

- Consumer operation with overexcitation or power reduction
- Integrated DC-side disconnection (shorter connection time  $t_i$ )
- Input voltage: 24 VDC
- Max. output current  $I_{RMS}$ : 5 A
- UL-approved

The ROBA®-switch 24V with integrated DC-side disconnection is not suitable for being the only safety disconnection in applications!

### Function

The ROBA®-switch 24V units are used for an input voltage of 24 VDC. They can switch internally, meaning that the output voltage switches to holding voltage from the input voltage (=overexcitation voltage) via pulse-width modulation using 20 kHz. The overexcitation time can be adjusted via a DIP switch to 150 ms, 450 ms, 1 s, 1.5 s and 2.15 s. The holding voltage can be adjusted via a further DIP switch to  $\frac{1}{4}$ ,  $\frac{1}{3}$ ,  $\frac{1}{2}$  and  $\frac{2}{3}$  of the input voltage (equals 6 V, 8 V, 12 V and 16 V at an input voltage of 24 V).

Apart from this, the ROBA®-switch 24V has an integrated DC-side disconnection. In contrast to the usual DC-side disconnection, no further protective measures or external components are required. The DC-side disconnection is activated in standard mode and causes short switching times on the electromagnetic consumer. This can, however, be deactivated by installing a bridge between terminals 7 and 8 in order to produce soft brakings and quieter switching noises. However, this substantially lengthens the switching times (approx. 6 – 10x).

### Electrical Connection (Terminals)

- 2 + 3 Input voltage, ground
- 4 Control input
- 5 – 7 Input voltage +24 VDC
- 8 + 9 Output voltage +
- 10 Output voltage -

### Technical Data

Input voltage $U_i$	24 VDC + 20 % / - 10 % SELV/PELV
Output voltage $U_o$	Input voltage $U_i$
Output voltage $U_H$	$\frac{1}{4}$ , $\frac{1}{3}$ , $\frac{1}{2}$ , $\frac{2}{3} \times U_i \pm 20 \%$
Output current $I_{RMS}$ at $\leq 45^\circ\text{C}$	5.0 A
Output current $I_{RMS}$ at max. $70^\circ\text{C}$	2.5 A
Protection	IP00
Terminal nominal cross-section	1.5 mm <sup>2</sup> (AWG 22-14)
Ambient temperature	-25 °C up to +70 °C
Storage temperature	-40 °C up to +70 °C

## Spark Quenching Unit Type 070.000.6

CE   
E189728

### Application

Reduces spark production on the switching contacts occurring during DC-side switch-off of inductive loads.

- Voltage limitation according to VDE 0580 2000-07, Item 4.6.
- Reduction of EMC-disturbance by voltage rise limitation, suppression of switching sparks.
- Reduction of brake engagement times by a factor of 2 – 4 compared to freewheeling diodes.

### Function

The spark quenching unit will absorb voltage peaks resulting from inductive load switching, which can cause damage to insulation and contacts. It limits these to 70 V and reduces the contact load. Switching products with a contact opening distance of > 3 mm are suitable for this purpose.

### Electrical Connection (Terminals)

- 1 (+) Input voltage
- 2 (-) Input voltage
- 3 (-) Coil
- 4 (+) Coil
- 5 Free nc terminal
- 6 Free nc terminal

### Dimensions (mm)

### Technical Data

Input voltage	max. 300 VDC, max. 615 V <sub>peak</sub> (rectified voltage 400 VAC, 50/60 Hz)
Switch-off energy	max. 9J/2 ms
Power dissipation	max. 0.1 Watt
Rated voltage nc terminals	250 V
Protection	IP65 components, IP20 terminals
Ambient temperature	-25 °C up to +85 °C
Storage temperature	-40 °C up to +85 °C
Max. conductor connection diameter	2.5 mm <sup>2</sup> (AWG 26-12)
Max. terminal tightening torque	0.5 Nm

# The Safe Brake Control ROBA®-SBCplus Type 021.100.2

## Technical Data

### Electrical connection

Supply voltage logic	24VDC -15%/+20%
Supply voltage power	24VDC or 48 VDC ±10%

### Inputs:

Safe inputs	4 (Y10 – Y23)
Standard inputs	4 (S35, S36, Y1, Y2)
Monitoring times	30 ms ... 4000 ms

### Outputs:

Supply voltage	24V 0.1A
Acknowledgement outputs	24V 0.1A
	O3 fault message
	O4 Status circuit 1
	O5 Status circuit 2
Test pulse outputs	T0, T1, 24V, 0.1A
Power outputs	O1, O2
Continuous operation	24V 2 x 4.5A max.
Continuous operation	48V 2 x 2.25A max.
Overexcitation	24V 2 x 6.5A max.
Overexcitation	48V 2 x 3.25A max.
Reduced voltages	6/8/12/16/24V ± 10%

Overexcitation times	100 ms ... 2500 ms
Cycle frequency	4/min max.
Ambient temperature	0 – 45 °C
Protection	IP20
Installation into control cabinet	IP54
Dimensions	45×100×120mm
Connection terminal	0.20 – 2.5mm², 24 – 12AWG
Clamping terminals	
per connection	2

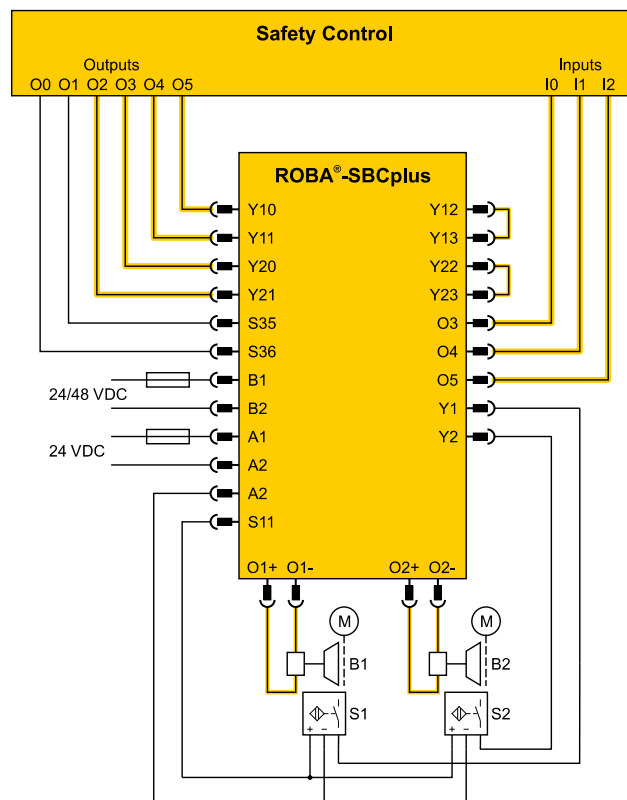

### Certification:

Type examination tested by TÜV (German Technical Inspectorate), CE

### Function:

- Safe control of 2 independent brakes
- Release monitoring via proximity switch or microswitch
- Fast or slow brake switch-off
- Safe monitoring of the switching times
- Parameterisation of the values
- Programmed and validated safety functions
- Safe signal output to the higher-level switching condition control

## Application Example

## ROBA-stop®-silenzio® – Guidelines

**Guidelines on the Declaration of Conformity:** A conformity evaluation has been carried out for the product (electromagnetic safety brake) in terms of the EC low voltage directive 2006/95/EC. The Declaration of Conformity is laid out in writing in a separate document and can be requested if required.

**Guidelines on the EMC Directive (2004/108/EC):** The product cannot be operated independently according to the EMC directive. Due to their passive state, brakes are also non-critical equipment according to the EMC. Only after integration of the product into an overall system can this be evaluated in terms of the EMC. For electronic equipment, the evaluation has been verified for the individual product in laboratory conditions, but not in the overall system.

**Guidelines on the Machinery Directive (2006/42/EC):** The product is a component for installation into machines according to the Machinery Directive 2006/42/EC. The brakes can fulfil the specifications for safety-related applications in coordination with other elements. The type and scope of the required measures result from the machine risk analysis. The brake then becomes a machine component and the machine manufacturer assesses the conformity of the safety device to the directive. It is forbidden to start use of the product until you have ensured that the machine accords with the regulations stated in the directive.

**Guidelines on the ATEX Directive:** Without a conformity evaluation, this product is not suitable for use in areas where there is a high danger of explosion. For application of this product in areas where there is a high danger of explosion, it must be classified and marked according to directive 94/9/EC.

### Safety Regulations

Brakes may generate several risks, among others:

During the risk assessment, the dangers involved must be evaluated and removed by taking appropriate protective measures.

**To prevent injury or damage, only professionals and specialists are allowed to work on the devices.** They must be familiar with the dimensioning, transport, installation, initial operation, maintenance and disposal according to the relevant standards and regulations.

### Application Conditions

The catalogue values are guideline values which have been determined in test facilities. It may be necessary to carry out your own tests for the intended application.

When dimensioning the brakes, please remember that installation situations, braking torque fluctuations, permitted friction work, run-in behaviour and wear as well as general ambient conditions can all affect the given values. These factors should therefore be carefully assessed, and alignments made accordingly.

- ☐ Mounting dimensions and connection dimensions must be adjusted according to the size of the brake at the place of installation.
- ☐ The magnetic coils are designed for a relative duty cycle of 100%. However, a duty cycle > 60 % leads to higher temperatures, which cause premature ageing of the noise damping and therefore lead to an increase in switching noises.
- ☐ The braking torque is dependent on the run-in condition of the brake.
- ☐ The brakes are only designed for dry running. The torque is lost if the friction surfaces come into contact with oil, grease, water or similar substances or foreign bodies.
- ☐ Manufacturer-side corrosion protection of the metallic surfaces.
- ☐ The rotors may rust up and block in corrosive ambient conditions and/or after long periods of storage.

**Ambient Temperature: -20 °C up to +40 °C**

### Earthing Connection

The brake is designed for Protection Class I. This protection covers not only the basic insulation, but also the connection of all conductive parts to the protective conductor (PE) on the fixed installation. Please carry out a standardised inspection of the protective conductor connections to all contactable metal parts!

### Protection

**(mechanical) IP10:** Protection against large body surfaces and large foreign bodies > 50 mm in diameter. No protection against water.  
**(electrical) IP54:** Dust-proof and protected against contact as well as against water spray from any direction.

### Intended Use

*mayr*®-brakes have been developed, manufactured and tested in compliance with the VDE 0580 standard and in accordance with the EU Low Voltage Directive as electromagnetic components. During installation, operation and maintenance of the product, the requirements for the standard must be observed. *mayr*®-brakes are for use in machines and systems and must only be used in the situations for which they are ordered and confirmed. Using them for any other purpose is not allowed.

### Guidelines for Electromagnetic Compatibility (EMC)

In accordance with the EMC directives 2004/108/EC, the individual components produce no emissions. However, functional components e.g. mains-side energisation of the brakes with rectifiers, phase demodulators, ROBA®-switch devices or similar controls can produce disturbance which lies above the allowed limit values.

For this reason it is important to read the Installation and Operational Instructions very carefully and to keep to the EMC Directives.

### Regulations, Standards and Directives Used

VDE 0580	Electromagnetic devices and components, general specifications
2006/95/EC	Low voltage directive
95/16/EC	Elevator Directive
EN 81-1	Safety regulations for the construction and installation of elevators and small goods elevators
BGV C1	(previously VGB 70) Safety regulations for theatre stage technical systems
CSA C22.2 No. 14-2010	Industrial Control Equipment
UL 508 (Edition 17)	Industrial Control Equipment
EN ISO 12100	Safety of machinery - General principles for design - Risk assessment and risk reduction
EN 61000-6-4	Interference emission
EN 12016	Interference immunity (for elevators, escalators and moving walkways)
EN 60204-1	Electrical equipment of machines

### Liability

- The information, guidelines and technical data in these documents were up to date at the time of printing. Demands on previously delivered brakes are not valid.
- Liability for damage and operational malfunctions will not be taken if:
  - the Installation and Operational Instructions are ignored or neglected.
  - the brakes are used inappropriately.
  - the brakes are modified.
  - the brakes are worked on unprofessionally.
  - the brakes are handled or operated incorrectly.

### Guarantee

- The guarantee conditions correspond with the Chr. Mayr GmbH + Co. KG sales and delivery conditions.
- Mistakes or deficiencies are to be reported to *mayr*® at once!

## Product Summary

### Safety Clutches/Overload Clutches

- **EAS®-Compact®/EAS®-NC/EAS®-smartic®**  
Positive locking and completely backlash-free torque limiting clutches
- **EAS®-reverse**  
Reversing, re-engaging torque limiter
- **EAS®-element clutch/EAS®-elements**  
Load-disconnecting protection against high torques
- **EAS®-axial**  
Exact limitation of tensile and compressive forces
- **EAS®-Sp/EAS®-Sm/EAS®-Zr**  
Load-disconnecting torque limiting clutches with switching function
- **ROBA®-slip hub**  
Load-holding, frictionally locked torque limiting clutches
- **ROBA®-contitorque**  
Magnetic continuous slip clutches
- **EAS®-HSC/EAS®-HSE**  
High-speed safety clutches for high-speed applications

### Shaft Couplings

- **smartflex®/primeflex®**  
Perfect precision couplings for servo and stepping motors
- **ROBA®-ES**  
Backlash-free and damping for vibration-sensitive drives
- **ROBA®-DS/ROBA®-D**  
Backlash-free, torsionally rigid all-steel couplings
- **ROBA®-DSM**  
Cost-effective torque-measuring couplings

### Electromagnetic Brakes/Clutches

- **ROBA-stop® standard**  
Multifunctional all-round safety brakes
- **ROBA-stop®-M motor brakes**  
Robust, cost-effective motor brakes
- **ROBA-stop®-S**  
Water-proof, robust monoblock brakes
- **ROBA®-duplostop®/ROBA®-twinstop®/ROBA-stop®-silenzio®**  
Doubly safe elevator brakes
- **ROBA®-diskstop®**  
Compact, very quiet disk brakes
- **ROBA®-topstop®**  
Brake systems for gravity loaded axes
- **ROBA®-linearstop**  
Backlash-free brake systems for linear motor axes
- **ROBA®-guidestop**  
Backlash-free holding brake for profiled rail guides
- **ROBATIC®/ROBA®-quick/ROBA®-takt**  
Electromagnetic clutches and brakes, clutch brake units

### DC Drives

- **tendo®-PM**  
Permanent magnet-excited DC motors
