[www.mayr[®].com](http://www.mayr.com)

We safeguard the movements of this world

Specialists for power transmission for more than a century

mayr® power transmission is one of the most traditional and yet most innovative German companies in the field of power transmission. From modest beginnings in the year 1897, the family enterprise from the Allgäu region has developed into world market leader. Today, approximately 700 employees work at the headquarters in Mauerstetten; about 1200 employees work for the company worldwide.

Unsurpassed - our standard range

mayr® power transmission offers an extensive variety of torque limiters, safety brakes, backlash-free shaft misalignment compensation couplings and high-quality DC drives. Also when it comes to customer-specific requirements, the company possesses the expertise to develop customized and economical solutions. This is why numerous renowned machine manufacturers trust in holistic solutions by *mayr*® power transmission.

Available worldwide

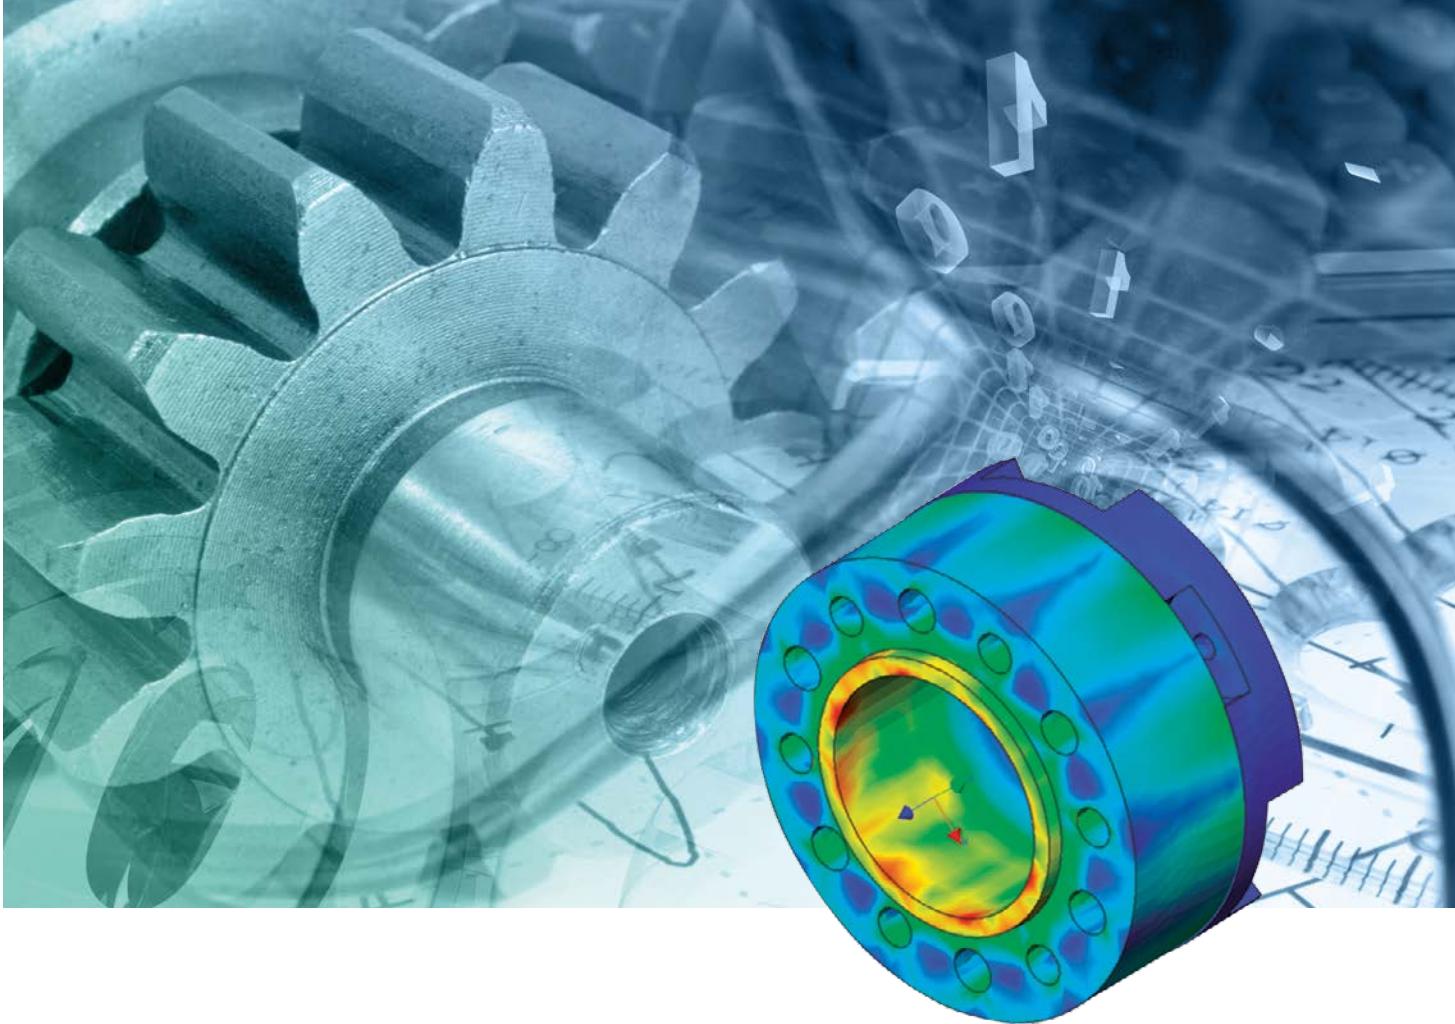

With eight subsidiaries in Germany, sales offices in the USA, France, Great Britain, Italy, Singapore and Switzerland as well as 36 additional country representatives, *mayr*® is available in all important industrial areas, guaranteeing optimum customer service around the globe.

Never compromise on safety

We make no compromises where safety is concerned. Only top products of a perfect quality guarantee that no people are injured or machines damaged in case of operational malfunctions, collisions and other hazardous situations. The safety of your employees and machines is our motivation to always provide the best and most reliable clutches, couplings or brakes.

mayr® power transmission holds numerous ground-breaking patents, and is the global market or technological leader for

- application-optimised **safety brakes**, for example for passenger elevators, stage technology and gravity loaded axes
- **torque limiters** to protect against expensive overload damage and production losses and
- backlash-free **servo couplings**.

Tradition and innovation – the best of both worlds

Tradition and innovation do not contradict each other - on the contrary. They are the two supporting pillars which have guaranteed stability and reliability for generations. Long-term stability, independence as well as a good reputation and satisfied customers are important values for a family enterprise rich in tradition.

Therefore, we place emphasis on:

- Tested product quality
- Optimum customer service
- Comprehensive know-how
- Global presence
- Successful innovations
- Effective cost management

Following our own objective of always offering our customers the technologically most advanced and economical solution, we have been able to gain the trust of many leading industrial companies from all branches and from all over the world as a reliable partner.

Place your trust in our know-how and our more than 50 years of experience in torque limiters, safety brakes and shaft couplings.

Tested quality and reliability

mayr® products are subject to meticulous quality inspections. These include quality assurance measures during the construction process as well as a comprehensive final inspection. Only the best, tested quality leaves our factory. All products are rigorously tested on calibrated test stands, and adjusted precisely to the requested values. An electronic database in which the measurement values are archived together with the associated serial numbers guarantees 100 % traceability. On request, we confirm the product characteristics with a test protocol.

The certification of our quality management according to DIN EN ISO 9001:2000 confirms the quality-consciousness of our colleagues at every level of the company.

EAS®-Compact® - the economically viable protection for machines

Function

If the set limit torque is exceeded, the clutch disengages. The torque drops immediately. A mounted limit switch registers the disengagement movement and switches off the drive. The limit switch signal can also be used for further control functions.

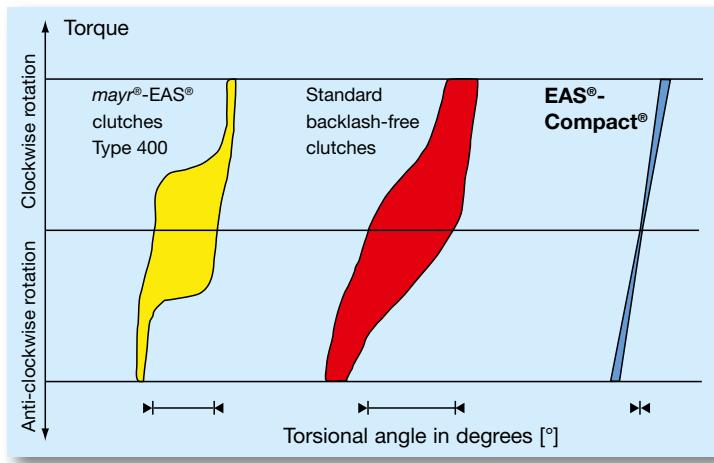

After the malfunction has been rectified, the EAS®-Compact® ratchetting clutches and the EAS®-Compact® synchronous clutches automatically re-engage (for a detailed description of the re-engagement behaviour, see page 5). EAS®-Compact® overload clutches separate the input and the output side completely and remain in this state until they are intentionally re-engaged by hand or via a suitable device. A detailed description of the overload clutches starts on page 26.

The EAS®-Compact® matrix for success

Product characteristics	Your advantages	Your benefits
Backlash-free torque transmission	Long lifetime, Low wear	Lowest maintenance effort
Safe, readable torque adjustment	Simple installation and operation	Time-saving during initial operation
High performance density	Low mass moment of inertia, compact construction	High machine dynamic
Convenient torque course in the drive line on overload	Optimised dimensioning	Effective and efficient machine construction

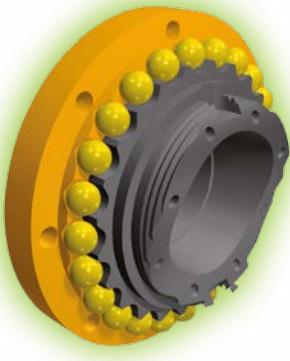

EAS®-Compact® – the backlash-free principle

Backlash means:

- The torsional angle between the input and output of the clutch
- Also known as "torsional backlash"
- Not to be confused with the transmission backlash from the shaft onto the hub
- At **mayr®**, backlash-free means:
Backlash → 0
(see diagram)

EAS®-Compact®/EAS®-NC Ratchetting clutch

- When the set limit torque is reached, the clutch disengages; the torque drops immediately.
- The clutch ratchets.
- After the cause of overload has been removed, the clutch automatically re-engages into the next of the series of ball detents.
- The clutch is ready for operation again.

EAS®-Compact®/EAS®-NC Synchronous clutch

- When the set limit torque is reached, the clutch disengages; the torque drops immediately.
- After the cause of overload has been removed, the clutch re-engages automatically after 360 angular degrees. Other cycle sequences, for example 180 degrees, are also available.
- The clutch is ready for operation again.

EAS®-Compact® overload clutch

If overload occurs, the EAS®-Compact® overload clutches separate the input and output almost residual torque-free. Therefore, they are the ideal protective element for fast-running drives and high mass moments of inertia.

A detailed description starts on **page 26**.

EAS®-Compact® ratchetting clutch/synchronous clutch

EAS®-Compact® torsionally rigid

EAS®-side cone bushing,
ROBA®-DS-side shrink disk hub
Type 496._1_.0, Sizes 01 to 4

Type 496._ _ _ .0
Sizes 01 to 4

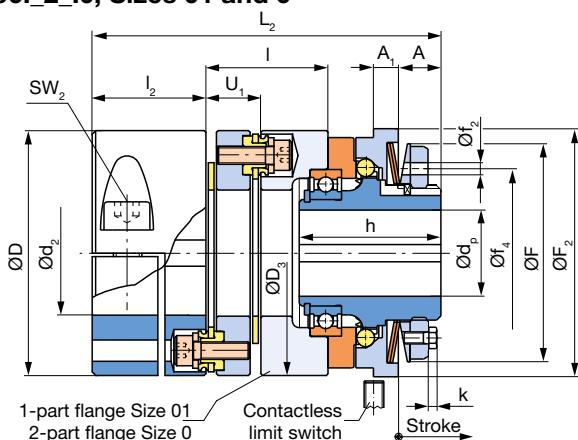

All EAS®-Compact® clutches can be combined with almost all components of the ROBA®-DS backlash-free shaft coupling. The Types shown here represent only a selection of the most established designs.

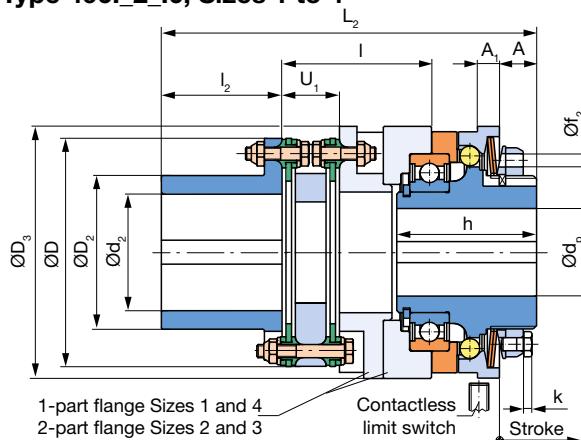

For further combination possibilities, see page 43.

We are happy to advise you on the dimensioning and configuration of your optimum clutch.

- See Technical Data, limit torque for overload M_g
- Standard ratchetting division is 15°; other ratchetting divisions optionally available (45°/60°/90°/120°/180°...)
- The transmittable torques on the flexible coupling "T_{KN}" are dependent on factors such as temperature, torsional rigidity, etc., see also coupling dimensioning ROBA®-ES catalogue K.940.V_- or contact the manufacturer. Furthermore, the transmittable torques of the flexible coupling are dependent on the bore diameter d₃ or d₄, see also Table 1 on page 50.

- Shaft tolerance up to Ø 38_{h6} over Ø 38_{h8}
- Transmittable torques available with smaller bores on request
- Smaller bores for smaller torques available on request
- Larger bores available on request
- Shaft tolerance up to Ø 40_{j6}
- Keyway 180° offset to "G"
- Dimensions in untensioned condition (shorter in tensioned condition)

EAS[®]-Compact[®] overload clutch

Function

If the set limit torque is exceeded, the clutch disengages. The torque drops immediately. A mounted limit switch registers the disengagement movement and switches off the drive. The limit switch signal can also be used for further control functions.

EAS[®]-Compact[®] overload clutches separate the input and the output side completely and remain in this state until they are intentionally re-engaged by hand or via a suitable device.

When in operation, the EAS[®]-Compact[®] overload clutches transmit the torque backlash-free. On overload occurrence, they ensure free run-out of the drive components.

The EAS[®]-Compact[®] overload clutches
Types 49_.5_4._, 49_.6_4._ and 49_.7_4._
are also available in ATEX design according
to directive 94/9 EC (ATEX 95).

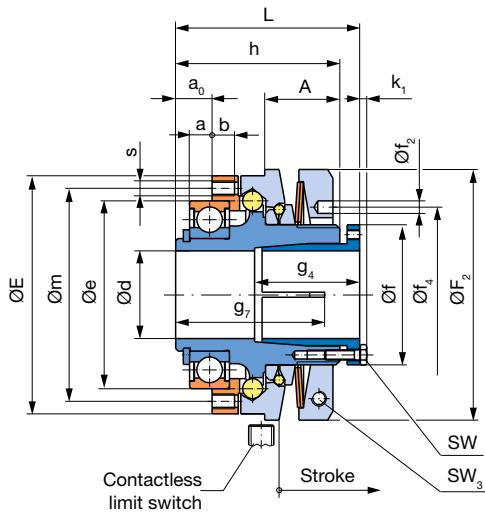

Summary of constructional designs EAS®-Compact® overload clutch

EAS®-Compact® overload short hub	Torque: 5 to 3000 Nm Sizes 01 to 3 Type 490._ _ 4.0 Sizes 4 and 5 as 2-bearing design Type 490._ _ 4.2	<ul style="list-style-type: none"> Flange clutch for direct installation of drive elements with the resulting radial force approximately in the bearing centre With cone bushing With key hub	Type 490._14._ Type 490._24._	Page 28

EAS®-Compact® Options

EAS®-Compact® with adjusting nut for radial torque adjustment

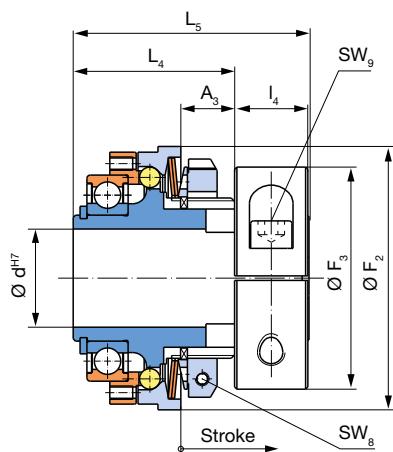

The EAS®-Compact® can be equipped with an adjusting nut for radial torque adjustment if the clutch cannot be accessed axially due to narrow installation conditions.

On this variant, the graduation for reading and adjusting the torque is mounted radially visible on the outer diameter.

Dimensions [mm]	Size				
	01	0	1	2	3
A ₂	12	13.5	16	17	20.5

F ₂	70	85	100	115	135
X	8	8	10	10	10
x	3.5	3.5	4	4	4

EAS®-Compact® with clamping ring

EAS®-Compact® clutches with clamping ring hub can be mounted extremely quickly and easily onto the shaft. The slotted clamping ring is tensioned using one single screw. Due to the equipment with an adjusting nut for radial torque adjustment, the limit torque for overload can be altered even in installed condition.

EAS®-Compact® Options

EAS®-Compact® torsionally rigid Modular Structure

EAS®-Compact® ratchetting, synchronous and overload clutches can be combined with almost all components of the ROBA®-DS backlash-free shaft coupling. For a current selection of different Types, please see pages 16 and 17 as well as pages 32 to 35.

We are happy to advise you on the dimensioning and configuration of your optimum design.

Technical Explanations

Readable Torque Adjustment

The EAS®-Compact® overload clutch offers easily readable torque adjustment on the adjusting nut (for Sizes 01 to 3). This readability makes adjusting the torque far more simple, and also allows easy checks on the set release value on the installed clutch.

- The limit torque can be finely adjusted and accurately read due to the adjusting nut with the fine thread and the easily-readable graduation scale.
- The positive-locking (or frictionally-locking) safeguard on the adjusting nut protects against self-turning, inadvertent adjustment of the set limit torque. The integral blocking protection prevents the cup springs from becoming spring-bound.

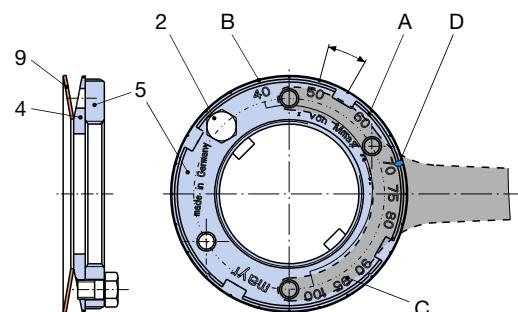

Fig. 1: EAS®-Compact® ratchetting and synchronous clutch

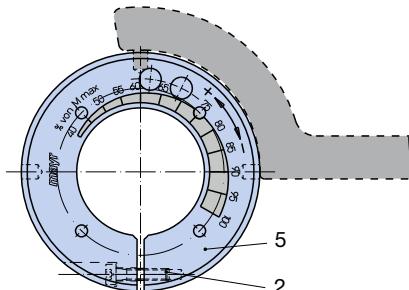

Fig. 2: EAS®-Compact® overload clutch

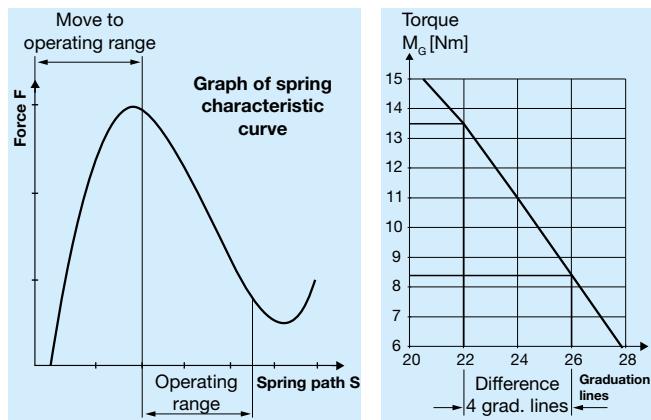

Fig. 3

(The diagram only serves as an example)

Fig. 4

(The diagram only serves as an example)

Depending on the drive and the drive constellation, torque peaks (e.g. via start-up torque impacts on asynchronous motors) can occur which lie substantially above the system (motor) operating torque. This behaviour is to be taken into account customer-side when dimensioning or adjusting the clutch.

Torque Adjustment

Adjustment takes place by turning the adjusting nut (5) (Sizes 03 to 3) or the set screws (6) (Sizes 4 and 5).

The installed cup springs (9) are operated in the negative range of the characteristic curve (Fig. 3). A stronger pre-tension produces a dropping in spring force. Turning the adjusting nut (5) (Sizes 03 to 3) or the set screws (6) (Sizes 4 and 5) clockwise therefore produces a decrease in spring force. Turning it anti-clockwise produces an increase in torque (facing direction towards the adjusting nut (5) – Figs. 1 and 2).

If no other torque adjustment is requested customer-side, the EAS®-Compact® ratchetting, synchronous and overload clutch is generally set and marked (calibrated) manufacturer-side to approx. 70 % of the respective maximum torque. The respective torque adjustment or the adjustable torque range are visible on the type tag.

A control "spring operation in the operating range" can be carried out via the dimension "a".

EAS®-Compact® ratchetting and synchronous clutch (Sizes 01-3): Dimension "a" is the distance between the adjusting nut facing-side (5) to the thrust washer facing-side (3) (Fig. 5).

EAS®-Compact® overload clutch (Sizes 01-3): Dimension "a" is the distance between the adjusting nut facing-side (5) to the hub edge (1) (Fig. 6).

For the corresponding data, please see the Installation and Operational Instructions.

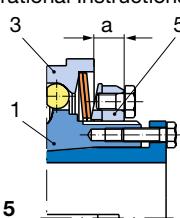

Fig. 5

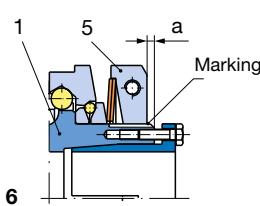

Fig. 6

EAS®-NC Sizes 03 and 02 must be adjusted according to the Adjustment Diagram (please order if necessary) if no adjustment or calibration was made manufacturer-side.

EAS®-NC Size 03 (Fig. 7):

- Unscrew both set screws (8) from the adjusting nut (5).
- Grease the thread surfaces on the adjusting nut (5) and the hub (1).
- Set the adjusting nut (5) to the required dimension "a" (acc. Adjustment Diagram) using a hook wrench.
- Paint both set screws (8) with Loctite 243, screw them into the adjusting nut (5) and tighten them.

EAS®-NC Size 02 (Fig. 8 and Fig. 4):

- Loosen the locking screw (2).
- Grease the thread and contact surfaces on the adjusting nut (5), the locking ring (4) and the hub (1).
- Set the adjusting nut (5) by hand up to contact on the cup spring (9).
- Continue to turn until the four notches on the circumference of the adjusting nut (5) and the notches in the locking ring (4) align.
- Turn the adjusting nut (5) further using a face wrench to the number of graduation lines which equal the required torque (Fig. 4, number of graduation lines in the Adjustment Diagram). The 4 notches on the circumference of the adjusting nut (5) and on the locking ring (4) must be in the same position.
- Paint the locking screw (2) with Loctite 243 and screw it into the adjusting nut (5).

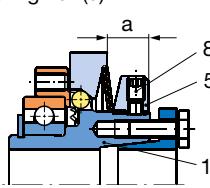

Fig. 7

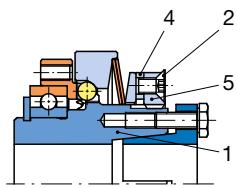

Fig. 8

Technical Explanations

Changing the Torque

Sizes 01 to 3 (Figs. 1, 2 and 6):

- Convert the required torque (acc. formula below) in percent of the maximum adjustment value.

Required torque adjustment	$\frac{\text{Required torque adjustment}}{\text{Max. torque adjustment}} \times 100 = \text{Adjustment in \%}$
Max. torque adjustment (see Table Technical Data)	

- Loosen the locking screw (2) in the adjusting nut (5).
- Turn the adjusting nut (5) clockwise or anti-clockwise according to the engraved adjustment scale (Figs. 1 and 2) using a hook wrench or a face wrench, until the required torque is set.
- The required torque results from:
 - the locking ring (4) marking (D) overlap and the percent value (C) on the adjusting nut (5) (ratchetting and synchronous clutch, Fig. 1), or
 - the hub (1) marking overlap and the percent value on the adjusting nut (5) (overload clutch, Figs. 2 and 6).
- Paint the locking screw (2) with Loctite 243 and screw it into the adjusting nut (5); the 4 notches (A) in the adjusting nut (5) and the notches (B) in the locking ring (4) must be in the same position (Fig. 1). Correct slightly if necessary.

Example:

EAS®-Compact® Size 3, Type 490.610.0 (M_G max. = 350 Nm):

Torque pre-adjustment = 70 % of M_G max. = 245 Nm.

The adjustment should be increased from 245 Nm to 280 Nm.

- Define the torque adjustment in percent of M_G max. using the formula below:

280	$\frac{280}{350} \times 100 = 80 \%$
350	

- Turn the adjusting nut (5) according to the facing-side scale (Fig. 1) **anti-clockwise** from 70 % to 80 % on the adjustment scale using a face wrench.

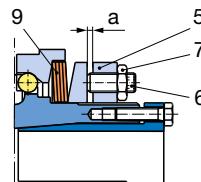

Fig. 9

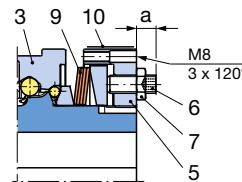

Fig. 10

Sizes 4 and 5 (Figs. 9 and 10):

The torque is changed exclusively via the set screws (6) and not via the adjusting nut (5).

- Loosen all hexagon nuts (7).
- Adjust all set screws (6) evenly to the required dimension "a" using a hexagon socket wrench.
 - EAS®-Compact® ratchetting and synchronous clutch, Size 4: find dimension "a" in the Adjustment Table glued to the clutch (Fig. 9).
 - EAS®-Compact® overload clutch, Sizes 4 - 5: find dimension "a" in the Adjustment Table (10) glued to the adjusting nut (5) (Fig. 10).
- Counter the set screws (6) again using hexagon nuts (7).

After de-installing the clutch (e.g. due to cup spring replacement or changes to the cup spring layering), the clutch must be re-adjusted.

Re-engagement of the EAS®-Compact® overload clutch

EAS®-Compact® overload clutch re-engagement is carried out by applying axial pressure onto the thrust washer (3). It may be necessary to turn between the clutch input and output sides slightly.

Re-engagement must only take place when the device is not running or at low differential speed (< 10 rpm). For a more detailed explanation on re-engagement, please see the respective Installation and Operational Instructions.

Depending on the equipment available, the accessibility of the installation point etc., re-engagement can be carried out in the following ways:

Sizes 01 to 3:

- Manually, e.g. using a plastic hammer or installation levers supported on the adjusting nut (5) (e.g. 2 screwdrivers placed opposite each other).
- By using an engagement mechanism. The engagement procedure can also be automated using pneumatic or hydraulic cylinders.

Sizes 4 and 5:

- By evenly screwing 3 hexagon head screws M8 (provided by the customer) into the adjusting nut (5) (Fig. 10).

After re-engagement has taken place, the three hexagon head screws must be removed immediately, as they could stop the clutch functioning (blockage).

- By using two screwdrivers, applied opposite each other and supported by the cup springs (9).
- By using an engagement mechanism. The engagement procedure can also be automated using pneumatic or hydraulic cylinders.

Permitted Bearing Load

The output element is centred on the deep groove ball bearing (tolerance H7/h5) and bolted together with the pressure flange (3).

If the resulting radial force from the output element is anywhere near the centre of the ball bearing and under the maximum permitted radial load according to Table 1, an additional bearing for the output element is unnecessary.

No appreciable axial forces (see Table 1) should be transferred from the output element onto the clutch pressure flange (3).

Permitted bearing load	Size								
	03	02	01	0	1	2	3	4	5
Axial forces F_A [kN]	0.12	0.28	0.65	1	1.5	2.4	4.2	5	7.7
Radial forces F_R [kN]									
1-bearing design	0.1	0.25	0.65	1	1.5	2.4	4.2	5	-
2-bearing design	0.15	0.375	1	1.5	2.25	3.6	6.3	7.5	11.5
Transverse force torques* M_Q [Nm]	0.5	1.5	5	10	20	30	40	50	70

Table 1

* Torques, which put strain on the deep groove ball bearing due to the non-centric axial forces having an effect on the pressure flange.

Limit Switch Type 055.00_.5 (Contactless)

Application

This device is used for measuring and monitoring axial and radial disengagement movements, e.g. on EAS®-clutches. It acts as a control sensor for electronic and mechanical sequences.

Function

When the sensor surface of the NAMUR sensor scans a metal control flag (damped), the signalling relay is triggered, is deenergised and drops. Contacts 1 - 2 are opened. Damping is possible from all sides.

Electrical Connection (Terminals)

1 – 2 – 3	Floating change-over contacts
5 – 6	Connection input voltage

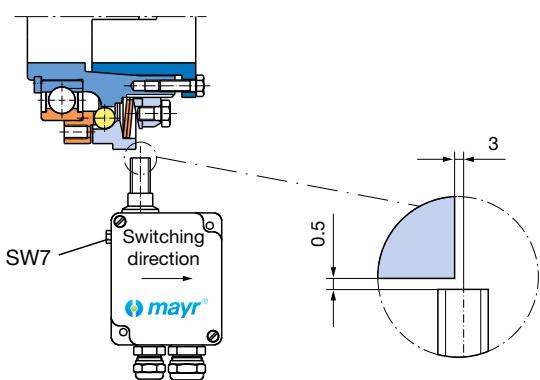

Design

The electronic amplifier is installed in a light metal housing. The limit switch is fixed using two screw-on mounting links attached diagonally with M4 cap screws.

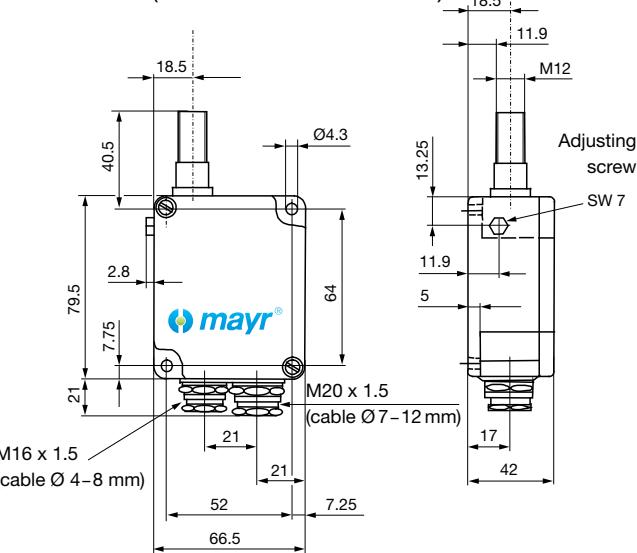

Technical Data

Input voltage (dependent on design)	230 VAC, ±10 %, 50 – 60 Hz 115 VAC, ±10 %, 50 – 60 Hz 24 VDC, PELV, ±5 %, protected against reverse polarity, for overvoltage category II connection
Power consumption	Max. 1.5 VA
Ambient temperature	-10 °C up to +60 °C limit switch -25 °C up to +60 °C NAMUR sensor
Protection	IP54
Conductor cross-section	Max. 2.5 mm ² / AWG 14
Weight	400 g / 14 oz
Protection fuse	0.1 A/fast acting at 24 VDC (in system)
Signalling relay	Floating change-over contacts Contact load max. 250 VAC / 12 A Contact material AgNi 90/10 max. switching frequency 20 Hz at min. load, 0.1 Hz at max. load
NAMUR sensor internal	Installed in a light metal housing, switching distance S _n 2 mm, flush fitting, max. switching frequency 2 kHz, the zero point can be set per 1 mm by means of the lateral adjusting screw SW 7
NAMUR sensor external	Metal housing M12 x 1, switching distance S _n 2 mm, flush fitting, max. switching frequency 2 kHz, standard cable length 2 m, max. 100 m on special design, protection IP67

Limit Switch Type 055.000.5 (Mechanical Operation)

Application

This device is used to monitor mechanical movements and end positions. It is a controlling sensor for electronic and mechanical sequences. It also detects axial disengagement movements, e.g. on EAS®-clutches.

Function

The pre-tensioned contact is discharged by actuating the switching lever:
 Contacts 11 – 14 (21 – 24) open, contacts 11 – 12 (21 – 22) close.

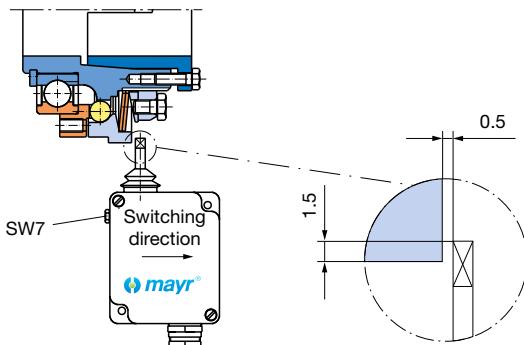

Design

The microswitch is fitted into a light metal housing and is actuated by a switching lever. Operation is only possible in one direction. The limit switch is fixed using two screw-on mounting links attached diagonally with M4 cap screws.

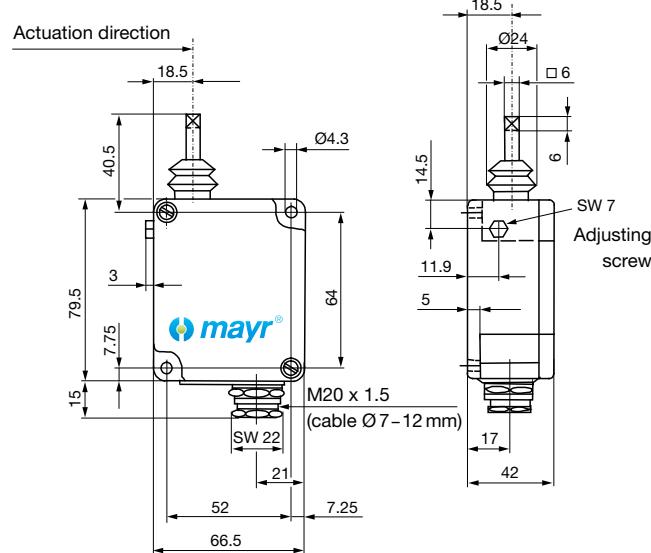

Technical Data

Contact	1 change-over contact (special design: 2 change-over contacts)
Switching power	250 VAC / 15 A (with 2 change-over contacts: 10 A) 24 VDC / 6 A 60 VDC / 1.5 A 250 VDC / 0.2 A min. 12 VDC / 10 mA
Contact material	AgSnO
Switching frequency	Max. 200 switching operations/min
Ambient temperature:	-10 °C up to +85 °C
Protection	IP54
Weight	275 g
Switching travel setting	Using the adjusting screw (SW 7), the zero point can be moved right or left by max. 5 mm
Switching travel	Pretravel: min. 0.15 to 0.5 mm Overtravel: max. 10 mm, depending on the zero point setting
Special types	Different switching lever lengths as well as a design with 2 change-over contacts are possible on request

Limit Switch Type 055.010.6 (Mechanical Operation, Multi-directional)

Application

The limit switch is used to monitor and measure axial or radial mechanical movements and adjustments e.g. on EAS®-clutches. The device is suitable for clutches with a minimum stroke of 1.1 mm with radial actuation and 0.9 mm with axial actuation.

Function

By actuating the metal tappet, contacts 11 – 12 are opened.

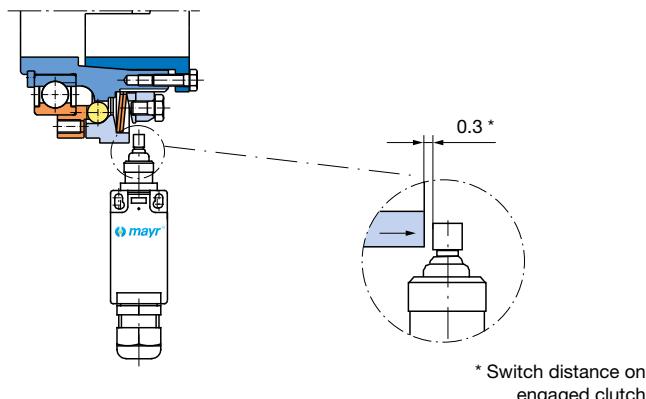

Electrical Connection (Terminals)

11 – 12 NC contact

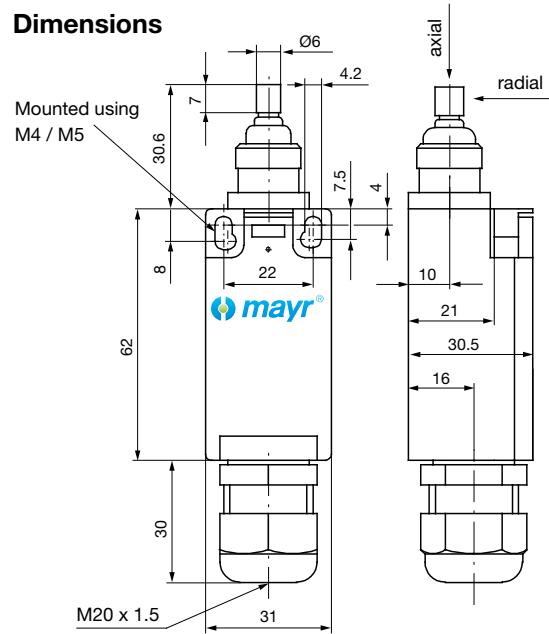

Technical Data

Contact	1 x NC contact, positive opening contacts
Contact (Special Design)	additional 1 x NO contact, terminals 23 – 24, galvanically separated (Zb) see Switching Travel Diagram
Contact-opening	see Switching Travel Diagram
Contact-closing	see Switching Travel Diagram
Contact-load	NC contact 250 VAC / 2.5 A 24 VDC / 1 A min. 12 VDC / 10 mA
Contact distance 250 VAC	>1.25 mm axial, forced opening
Contact distance 24 VDC	<1.25 mm, min. 0.5 mm
Contact material	Ag90Ni10
Max. input current	acc. DIN EN 60947-5-1 AC15 / DC13
Metal tappet travel	max. 4 mm axial or radial
Switching frequency	max. 100/min.
Mechanical lifetime	1 x 10 ⁶ switching cycles, unloaded
Conductor cross-section	1.5 mm ² / AWG 16
Ambient temperature:	-30 °C up to +80 °C
Protection	IP65
Protection insulation	acc. Protection Class II
Housing	thermoplastic, self extinguishing acc. UL94-V0
Weight	120 g / 4.2 oz

Installation

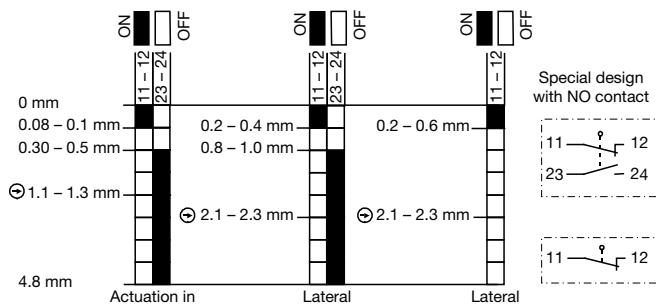

Dimensions

Fixed positioning for safety application with fixing screws
2 x M5 (DIN 912).

Switching Travel Diagram

Do not install switch so that it drags and observe
max. actuation travel (travel of metal tappet).

Installation Examples

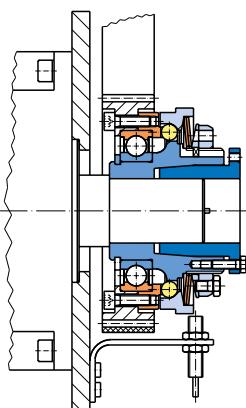

EAS®-Compact® short hub

The drive elements of the EAS®-Compact® short hub are centred on the deep groove ball bearing and are screwed together with the pressure flange. If the resulting radial force from the drive element is anywhere near the centre of the ball bearing, an additional bearing for the drive element is unnecessary.

The screw quality and the tightening torque for the fixing screws of the drive element are to be selected so that the set limit torque can be safely transmitted using frictional locking.

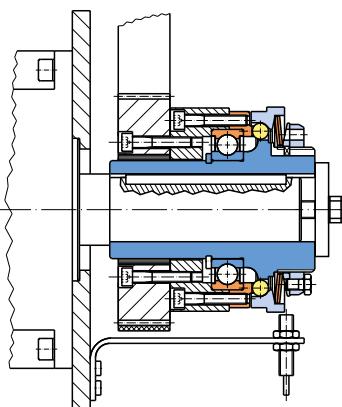

Fig. 1

EAS®-Compact® long protruding hub

The EAS®-Compact® long protruding hub is recommended for very wide drive elements or for elements with very small diameters. On a small diameter, the drive element is screwed together via a customer-side intermediate flange with the clutch pressure flange. Ball bearings, needle bearings or plain bearings are suitable as bearings for the drive element, depending on the installation situation and the installation space.

Fig. 2

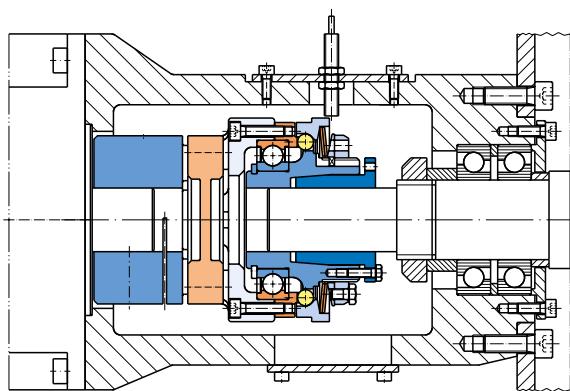

EAS®-Compact® with flexible shaft coupling

The EAS®-Compact® with a backlash-free, torsionally flexible and vibration-damping shaft coupling for the connection of two shafts. The coupling compensates for axial, radial and angular shaft misalignments. In comparison to the EAS®-Compact® with steel bellows coupling, this product is torsionally flexible to a small extent in the circumferential direction.

In the installation example on the right, the EAS®-Compact® elastic is mounted backlash-free between the rotor and a ball screw spindle. The torque is transmitted backlash-free up to the point of disengagement and drops immediately on overload. The contactless limit switch (sensor) emits a signal to switch off the drive.

Fig. 3

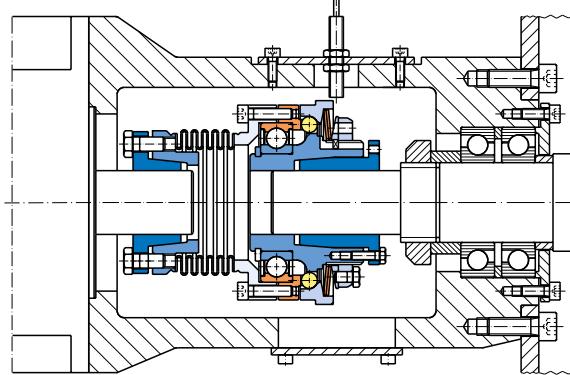

EAS®-Compact® with steel bellows coupling

The EAS®-Compact® with a torsionally rigid flexible steel bellows coupling for the connection of two shafts. The coupling compensates for axial, radial and angular shaft misalignments. It is torsionally rigid in the circumferential direction.

In comparison with the EAS®-Compact® with ROBA®-D coupling, the EAS®-Compact® with steel bellows coupling has a lower mass moment of inertia.

In the installation example on the right, the EAS®-Compact® with steel bellows coupling is mounted between the rotor and a ball screw spindle. The torque is transmitted backlash-free up to the point of disengagement and drops immediately on overload. The contactless limit switch (sensor) emits a signal to switch off the drive.

Fig. 4

Product Summary

Safety Clutches/Overload Clutches

- EAS®-Compact®/EAS®-NC/EAS®-smartic®**
Positive locking and completely backlash-free torque limiting clutches
- EAS®-reverse**
Reversing re-engaging torque limiting clutch
- EAS®-element clutch/EAS®-elements**
Load-disconnecting protection against high torques
- EAS®-axial**
Exact limitation of tensile and compressive forces
- EAS®-Sp/EAS®-Sm/EAS®-Zr**
Load-disconnecting torque limiting clutches with switching function
- ROBA®-slip hubs**
Load-holding, frictionally locked torque limiting clutches
- ROBA®-contitorque**
Magnetic continuous slip clutches
- EAS®-HSC/EAS®-HSE**
High-speed safety clutches for high-speed applications

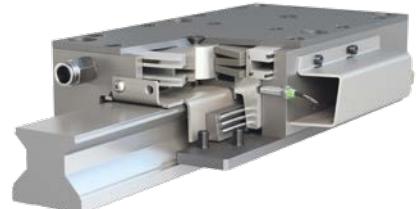

Shaft Couplings

- smartflex®/primeflex®**
Perfect precision couplings for servo and stepping motors
- ROBA®-ES**
Backlash-free and damping for vibration-sensitive drives
- ROBA®-DS/ROBA®-D**
Backlash-free, torsionally rigid all-steel couplings
- ROBA®-DSM**
Cost-effective torque-measuring couplings

Electromagnetic Brakes/Clutches

- ROBA-stop® standard**
Multifunctional all-round safety brakes
- ROBA-stop®-M motor brakes**
Robust, cost-effective motor brakes
- ROBA-stop®-S**
Water-proof, robust monoblock brakes
- ROBA®-duplostop®/ROBA®-twinstop®/ROBA-stop®-silenzio®**
Doubly safe elevator brakes
- ROBA®-diskstop®**
Compact, very quiet disk brakes
- ROBA®-topstop®**
Brake systems for gravity loaded axes
- ROBA®-linearstop**
Backlash-free brake systems for linear motor axes
- ROBA®-guidestop**
Backlash-free holding brake for profiled rail guides
- ROBATIC®/ROBA®-quick/ROBA®-takt**
Electromagnetic clutches and brakes, clutch brake units

DC Drives

- tendo®-PM**
Permanent magnet-excited DC motors
